### 1 Introduction

**Remark 1.1.** This course is about vector spaces and linear transformations between them; a vector space involves multiplication by scalars, where the scalars come from some field. We recall first examples of fields, then vector spaces, as a motivation, before presenting a formal definition.

### 1.1 Vector Spaces

**Remark 1.2.** *Much of this is recall from Algebra 1.* 

#### **SEXAMPLE 1.1: Examples of Fields**

- 1. Q; the field of rational numbers.
- 2.  $\mathbb{R}$ ; the field of real numbers;  $\mathbb{Q} \subseteq \mathbb{R}$ .
- 3.  $\mathbb{C}$ ; the field of complex numbers;  $\mathbb{Q} \subseteq \mathbb{R} \subseteq \mathbb{C}$ .
- 4.  $\mathbb{F}_p \equiv \mathbb{Z}/p\mathbb{Z} \equiv \{0, 1, \dots, p-1\}$ ; the (unique) field of pelements, where pprime.
  - (a) p = 2;  $\mathbb{F}_2 \equiv \{0, 1\}$ .
  - (b) p = 3;  $\mathbb{F}_3 \equiv \{0, 1, 2\}$ .
  - (c) ···

<sup>a</sup>where  $a +_p b :=$  remainder of  $\frac{a + b}{p}$ ,  $a \cdot_p b :=$  remainder of  $\frac{a \cdot b}{p}$ .

**Remark 1.3.** *Throughout the course, we will denote an abstract field as*  $\mathbb{F}$ *.* 

## **® Example 1.2: Examples of Vector Spaces**

- 1.  $\mathbb{R}^3 := \{(x, y, z) : x, y, z \in \mathbb{R}\}$ . We can add elements in  $\mathbb{R}^3$ , and multiply them by real scalars.
- 2.  $\mathbb{F}^n := \underbrace{\mathbb{F} \times \mathbb{F} \times \cdots \mathbb{F}}_{n \text{ times}} := \{(a_1, a_2, \dots, a_n) : a_i \in \mathbb{F}\}, \text{ where } n \in \mathbb{N}^1; \text{ this is a generalization of the previous example, where we took } n = 3, \mathbb{F} = \mathbb{R}. \text{ Operations follow identically; addition:}$

$$(a_1, a_2, \ldots, a_n) + (b_1, b_2, \ldots, b_n) := (a_1 + b_1, a_2 + b_2, \ldots, a_n + b_n)$$

and, taking a scalar  $\lambda \in \mathbb{F}$ , multiplication:

$$\lambda \cdot (a_1, a_2, \dots, a_n) := (\lambda \cdot a_1, \lambda \cdot a_2, \dots, \lambda \cdot a_n).$$

We refer to these elements  $(a_1, \dots, a_n)$  as *vectors* in  $\mathbb{F}^n$ ; the vector for which  $a_i = 0 \,\forall i$  is the 0 *vector*, and is the additive identity, making  $\mathbb{F}^n$  an abelian group under addition, that admits

multiplication by scalars from  $\mathbb{F}$ .

- 3.  $C(\mathbb{R}) := \{ f : \mathbb{R} \to \mathbb{R} : f \text{ continuous} \}$ . Here, we have the constant zero function as our additive identity  $(x \mapsto 0 \,\forall x)$ , and addition/scalar multiplication of two continuous real functions are continuous.
- 4.  $\mathbb{F}[t] := \{a_0 + a_1t + a_2t^2 + \dots + a_nt^n : a_i \in \mathbb{F} \forall i, n \in \mathbb{N}\}$ , ie, the set of all polynomials in t with coefficients from  $\mathbb{F}$ . Here, we can add two polynomials;

$$(a_0 + a_1t + \dots + a_nt^n) + (b_0 + b_1t + \dots + b_mt^m) := \sum_{i=0}^{\max\{n,m\}} (a_i + b_i)t^i,$$

(where we "take" undefined  $a_i/b_i$ 's as 0; that is, if m > n, then  $a_{m-n}, a_{m-n+1}, \ldots, a_m$  are taken to be 0). Scalar multiplication is defined

$$\lambda \cdot (a_0 + a_1t + a_2t^2 + \dots + a_nt^n) := \lambda a_0 + \lambda a_1t + \lambda a_2t^2 + \dots + \lambda a_nt^n.$$

Here, the zero polynomial is simply 0 (that is,  $a_i = 0 \forall i$ ).

### **○** Definition 1.1: Vector Space

A vector space V over a field  $\mathbb{F}$  is an abelian group with an operation denoted + (or  $+_V$ ) and identity element<sup>2</sup>denoted  $0_V$ , equipped with scalar multiplication for each scalar  $\lambda \in \mathbb{F}$  satisfying the following axioms:

- 1.  $1 \cdot v = v$  for  $1 \in \mathbb{F}$ ,  $\forall v \in V$ .
- 2.  $\alpha \cdot (\beta \cdot v) = (\alpha \cdot \beta)v, \forall \alpha, \beta \in \mathbb{F}, v \in V.$
- 3.  $(\alpha + \beta) \cdot v = \alpha \cdot v + \beta \cdot v, \forall \alpha, \beta \in \mathbb{F}, v \in V.$
- 4.  $\alpha \cdot (u+v) = \alpha \cdot u + \alpha \cdot v, \forall \alpha \in \mathbb{F}, u, v \in V.$

We refer to elements  $v \in V$  as vectors.

<sup>&</sup>lt;sup>1</sup>Where we take  $0 \in \mathbb{N}$ , for sake of consistency. Moreover, by convention, we define  $\mathbb{F}^0$  (that is, when n = 0) to be  $\{0\}$ ; the trivial vector space.

<sup>&</sup>lt;sup>2</sup>The "zero vector".

### **→ Proposition 1.1**

For a vector space V over a field  $\mathbb{F}$ , the following holds:

- 1.  $0 \cdot v = 0_V$ ,  $\forall v \in V$  (where  $0 := 0_{\mathbb{F}}$ )
- 2.  $-1 \cdot v = -v$ ,  $\forall v \in V$  (where  $1 := 1_{\mathbb{F}}$ )<sup>3</sup>
- 3.  $\alpha \cdot 0_V = 0_V, \forall \alpha \in \mathbb{F}$

*Proof.* 1.  $0 \cdot v = (0+0) \cdot v = 0 \cdot v + 0 \cdot v \implies 0 \cdot v = 0_V$  (by "cancelling" one of the  $0 \cdot v$  terms on each side).

- 2.  $v + (-1 \cdot v) = (1 \cdot v + (-1) \cdot v) = (1 1) \cdot v = 0 \cdot v = 0_V \implies (-1 \cdot v) = -v$ .
- 3.  $\alpha \cdot 0_V = \alpha \cdot (0_V + 0_V) = \alpha \cdot 0_V + \alpha \cdot 0_V \implies \alpha \cdot 0_V = 0_V$  (by, again, cancelling a term on each side).

← Lecture 01; Last Updated: Mon Mar 25 13:48:03 EDT 2024

# 1.2 Creating Spaces from Other Spaces

### → Definition 1.2: Product/Direct Sum of Vector Spaces

For vector spaces U, V over the same field  $\mathbb{F}$ , we define their *product* (or *direct sum*) as the set

$$U \times V = \{(u, v) : u \in U, v \in V\},$$

with the operations:

$$(u_1, v_1) + (u_2, v_2) := (u_1 + u_2, v_1 + v_2)$$
  
 $\lambda \cdot (u, v) := (\lambda \cdot u, \lambda \cdot v)$ 

# $\otimes$ Example 1.3: $\mathbb{F}$

 $\mathbb{F}^2 = \mathbb{F} \times \mathbb{F}$ , where  $\mathbb{F}$  is considered as the vector space over  $\mathbb{F}$  (itself).

<sup>3</sup>NB: "additive inverse"

### **→ Definition 1.3: Subspace**

For a vector space V over a field  $\mathbb{F}$ , a *subspace* of V is a subset  $W \subseteq V$  s.t.

- 1.  $0_V \in W^4$
- 2.  $u + v \in W \ \forall u, v \in W$  (closed under addition)
- 3.  $\alpha \cdot u \in W \ \forall \ u \in W, \alpha \in \mathbb{F}^5$

Then, *W* is a vector space in its own right.

#### **® Example 1.4: Examples of Subspaces**

- 1. Let  $V := \mathbb{F}^n$ .
  - $W := \{(x_1, x_2, \dots, x_n) \in \mathbb{F}^n : x_1 = 0\} = \{(0, x_2, x_3, \dots, x_n) : x_i \in \mathbb{F}\}.$
  - $W := \{(x_1, x_2, \dots, x_n) \in \mathbb{F}^n : x_1 + 2 \cdot x_2 = 0\}$

<u>Proof.</u> Let  $x = (x_1, ..., x_n)$ ,  $y = (y_1, ..., y_n) \in W$ . Then,  $x + y = (x_1 + y_1, ..., x_n + y_n)$ , and  $x_1 + y_1 + 2 \cdot (x_2 + y_2) = x_1 + 2 \cdot x_2 + y_1 + 2 \cdot y_2 = 0 + 0 = 0 \implies x + y \in W$ . Similar logic follows for axioms 2., 3.

• (More generally)

$$a_{11}x_1 + \dots + a_{1n}x_n = 0$$

$$W := \{(x_1, \dots, x_n) \in \mathbb{F}^n : a_{21}x_1 + \dots + a_{2n}x_n = 0 \},$$

$$\vdots$$

$$a_{k1}x_1 + \dots + a_{kn}x_n = 0$$

that is, a linear combination of homogenous "conditions" on each term.

- $W^* := \{(x_1, \dots, x_n) : x_1 + x_2 = 1\}$  is *not* a subspace; it is not closed under addition, nor under scalar multiplication.
- 2. Let  $\mathbb{F}[t]_n := \{a_0 + a_1t + \dots + a_nt^n : a_i \in \mathbb{F}\}$ . Then,  $\mathbb{F}[t]_n$  is a subspace of  $\mathbb{F}[t]$ , the more general polynomial space. *However*, the set of all polynomials of degree *exactly n* (all axioms fail, in fact) is not a subspace of  $\mathbb{F}[t]_n$ .
  - $W := \{p(t) \in \mathbb{F}[t]_n : p(1) = 0\}.$
  - $W := \{ p(t) \in \mathbb{F}[t]_n : p''(t) + p'(t) + 2p(t) = 0 \}.$

<sup>&</sup>lt;sup>4</sup>This is equivalent to requiring that  $W \neq \emptyset$ ; stated this way, axiom 3. would necessitate that  $0 \cdot w = 0_V \in W$ .

<sup>&</sup>lt;sup>5</sup>Note that these axioms are equivalent to saying that W is a subgroup of V with respect to vector addition; 2. ensures closed under addition, and 3. ensures the existence of additive inverses (as per  $-1 \cdot v = -v$ ).

3. Let  $V := C(\mathbb{R})$  be the space of continuous function  $\mathbb{R} \to \mathbb{R}$ .

• 
$$W := \{ f \in C(\mathbb{R}) : f(\pi) + 7f(\sqrt{2}) = 0 \}.$$

- $W := C^1(\mathbb{R}) := \text{everywhere differentiable functions.}$
- $W := \{ f \in C(\mathbb{R}) : \int_0^1 f \, dx = 0 \}.$

### **→ Proposition 1.2**

Let  $W_1$ ,  $W_2$  be subspaces of a vector space V over  $\mathbb{F}$ . Then, define the following:

1. 
$$W_1 + W_2 := \{w_1 + w_2 : w_1 \in W_1, w_2 \in W_2\}$$

2. 
$$W_1 \cap W_2 := \{ w \in V : w \in W_1 \land w \in W_2 \}$$

These are both subspaces of V.

*Proof.* 1. (a)  $0_V \in W_1$  and  $0_V \in W_2 \implies 0_V = 0_V + 0_V \in W_1 + W_2$ .

(b) 
$$(u_1 + u_2) + (v_1 + v_2) = (u_1 + v_1) + (u_2 + v_2) \in W_1 + W_2$$
.

(c) 
$$\alpha \cdot (u + v) = \alpha \cdot u + \alpha \cdot v \in W_1 + W_2$$

2. (a)  $0_V \in W_1$  and  $0_V \in W_2 \implies 0_V = 0_V + 0_V \in W_1 \cap W_2$ .

(b) 
$$u, v \in W_1 \cap W_2 \implies u + v \in W_1 \wedge u + v \in W_2 \implies u + v \in W_1 \cap W_2$$
.

(c)  $\alpha \cdot u \in W_1 \wedge \alpha \cdot u \in W_2 \implies \alpha \cdot u \in W_1 \cap W_2$ .

# 1.3 Linear Combinations and Span

## → **Definition** 1.4: Linear Combination

Let V be a vector space over a field  $\mathbb{F}$ . For finitely many vectors  $v_1, v_2, \ldots, v_n$ , their *linear combination* is a sum of the form

$$\sum_{i=1}^n a_i v_i = a_1 \cdot v_1 + \dots + a_n \cdot v_n,$$

where  $a_i \in \mathbb{F} \forall i$ .

A linear combination is called *trivial* if  $a_i = 0 \,\forall i$ , that is, all coefficients are 0.

If n = 0 (ie, we are "summing up" 0 vectors), we define the sum as the zero vector;  $\sum_{i=1}^{0} a_i v_i := 0_V$ .

← Lecture 02; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### → Definition 1.5: A More General Definition of Linear Combination

For a (possibly infinite) set S of vectors from V, a *linear combination* of vectors in S is a linear combination of  $a_1v_1 + \cdots + a_nv_n$  for some finite subset  $\{v_1, \ldots, v_n\} \subseteq S$ .

#### **○→ Definition 1.6: Span**

For a subset  $S \subseteq V$ , we define its *span* as

Span(S) := set of all linear combinations of S := { $a_1v_1 + \cdots + a_nv_n : a_i \in \mathbb{F}, v_i \in S$  }.

By convention, we set  $Span(\emptyset) = \{0_V\}$ .

#### **⊗ Example 1.5**

Let  $S := \{(1, 0, -1), (0, 1, -1), (1, 1, -2)\} \subseteq \mathbb{R}^3$ . Then,

$$0_{\mathbb{R}^3} = (0,0,0) = 1 \cdot (1,0,-1) + 1 \cdot (0,1,-1) + -1 \cdot (1,1,-2).$$

We claim, moreover, that Span(S) = U := {(x, y, z)  $\in \mathbb{R}^3$  : x + y + z = 0} (a plane through the origin).

*Proof.* Note that  $S \subseteq U$ , hence  $S \subseteq \operatorname{Span} S \subseteq U$ . OTOH, if  $(x, y, z) \in U$ , we have z = -x - y, and so

$$(x, y, z) = (x, y, -x - y) = x \cdot (1, 0, -1) + y \cdot (0, 1, -1) \in \text{Span}(S)$$

hence  $U \subseteq \operatorname{Span}(S)$  and thus  $\operatorname{Span}(S) = U$ .

**Remark 1.4.** We implicitly used the following claim in the proof above; we prove it more generally.

## **→ Proposition 1.3**

Let V be a vector space over  $\mathbb{F}$  and let  $S \subseteq V$ . Then,  $\operatorname{Span}(S)$  is always a subspace. Moreover, it is the smallest (minimal) subspace containing S (that is, for any subspace  $U \supseteq S$ , we have that  $U \supseteq \operatorname{Span} S$ ).

<u>Proof.</u> Because adding/scalar multiplying linear combinations of elements of S again results in a linear combination of elements of S, and  $O_V \in \text{Span}(S)$  by definition, we have that Span(S) is indeed a subspace.

If  $U \supset S$  is a subspace of V containing S, then by definition U is closed under addition, that is, taking linear combinations of its elements (in particular, of elements of S); hence,  $U \supset \text{Span}(S)$ .

### **← Lemma 1.1**

For  $S \subseteq V$  and  $v \in V$ ,  $v \in \operatorname{Span}(S) \iff \operatorname{Span}(S \cup \{v\}) = \operatorname{Span}(S)$ .

<sup>&</sup>lt;sup>6</sup>That is, we do not allow infinite sums.

*Proof.* ( $\Longrightarrow$ ) Let  $v \in \text{Span}(S) \Longrightarrow v = a_1v_1 + \cdots + a_nv_n$ ,  $a_i \in \mathbb{F}$ ,  $v_i \in V$ . Then, for any linear combination

$$b_1u_1 + \cdots + b_mu_m + b \cdot v = b_1u_1 + \cdots + b_mu_m + b(a_1v_1 + \cdots + a_nv_n)$$

is a linear combination of vectors in  $S \cup \{v\}$  (first equality) or equivalently, a combination of vectors in S (second equality) and thus Span $(S \cup \{v\}) \subseteq$  Span S. The reverse inclusion follows trivially.

$$(\longleftarrow) \operatorname{Span}(S \cup \{v\}) = \operatorname{Span} S \implies v \in \operatorname{Span}(S).$$

#### **⊗ Example 1.6**

(From the above example) We have

$$Span(\{(1,0,-1),(0,1,-1)\} \cup \{(1,1,-2)\}) = Span(\{(1,0,-1),(0,1,-1)\}),$$

since  $(1, 1, -2) \in \text{Span}(\{(1, 0, -1), (0, 1, -1)\})$  (it was redundant, as it could be generated by the other two vectors).

#### **○ Definition** 1.7: Spanning Set

Let *V* be a vector space over a field  $\mathbb{F}$ . We call  $S \subseteq V$  a *spanning set* for *V* if Span(S) = *V*. We call such a spanning set *minimal* if no proper subset of *S* is a spanning set ( $\nexists v \in S$  s.t.  $S \setminus \{v\}$  spanning).

**Remark 1.5.** Note that any  $S \subseteq V$  is spanning for Span(S). But, S may not be minimal; indeed, consider the previous example. We were able to remove a vector from S while having the same span.

### **⊗ Example 1.7**

For  $\mathbb{F}^n$  as a vector space over  $\mathbb{F}$ , the *standard spanning set* 

$$\operatorname{St}_{n} := \{\underbrace{(1,\ldots,0)}_{:=e_{1}}, \underbrace{(0,1,0,\ldots,0)}_{:=e_{2}}, \ldots, \underbrace{(0,\ldots,1)}_{e_{n}}\}.$$

Given any  $x := (x_1, \dots, x_n) \in \mathbb{F}^n$ , we can write

$$x = x_1 \cdot e_1 + \cdots \times x_n \cdot e_n.$$

This is clearly minimal; removing any  $e_i$  would then result in a 0 in the ith "coordinate" of a vector, hence St \{ $e_i$ } would span only vectors whose ith coordinate is 0.

### → <u>Definition</u> 1.8: Linear Dependence

Let *V* be a vector space over a field  $\mathbb{F}$ . A set  $S \subseteq V$  is said to be *linearly dependent* if there is a nontrivial linear combination of vectors in *S* that is equal to  $0_V$ .

Conversely, S is called *linearly independent* if there is no nontrivial linear combination of vectors in S that is equal to  $O_V$ ; all linear combinations of vectors in S that equal  $O_V$  are trivial.

← Lecture 03; Last Updated: Mon Mar 25 13:48:23 EDT 2024

#### **⊗ Example 1.8**

- 1. The empty set  $\emptyset$  is linearly independent; there are no non-trivial linear combinations that equal  $0_V$  (there are no linear combinations at all).
- 2. For  $v \in V$ , the set  $\{v\}$  is linearly dependent iff  $v = 0_V$ .
- 3.  $S := \{(1,0,-1),(0,1,-1),(1,1,-2)\} := \{v_1,v_2,v_3\}; S \text{ is linearly dependent } (v_1+v_2-v_3=(0,0,0)).$
- 4.  $V := \mathbb{F}^3$ ;  $S := \{(1, 0, -1), (0, 1, -1), (0, 0, 1)\} = \{v_1, v_2, v_3\}$  is linearly independent.

Proof. Suppose

$$a_1v_1 + a_2v_2 + a_3v_3 = 0_V$$

$$\implies a_1 = 0 \land a_2 = 0 \land -a_1 - a_2 + a_3 = 0 \implies a_3 = 0$$

$$\implies a_1 = a_2 = a_3 = 0$$

Hence only a trivial linear combination is possible.

5.  $St_n$  is linearly independent.

Proof.

$$\sum_{i=1}^{n} a_i e_i = 0_{\mathbb{F}^n} \implies a_i = 0 \,\forall i$$

#### **← Lemma 1.2**

Let *V* be a vector space over a field  $\mathbb{F}$  , and  $S \subseteq V$  (possibly infinite).

- 1. *S* is linearly dependent  $\iff$  there is a finite subset  $S_0 \subseteq S$  that is linearly dependent.
- 2. S is linearly independent  $\iff$  all finite subsets of S are linearly independent.

*Proof.* 2. follows from the negation of 1.

 $(\longleftarrow)$  Trivial.

( $\Longrightarrow$ ) Suppose S linearly dependent. Then,  $0_V$  = some nontrivial linear combination of vectors  $v_1, \ldots, v_n$  in S. Let  $S_0 = \{v_1, \ldots, v_n\}$ , then,  $S_0$  is linearly dependent itself.

# 1.4 Linear Dependence and Span

### **←** Proposition 1.4

Let *V* be a vector space over a field  $\mathbb{F}$  and  $S \subseteq V$ .

- 1. *S* linearly dependent  $\iff \exists v \in \text{Span}(S \setminus \{v\}).$
- 2. *S* linearly independent  $\iff$  there is no  $v \in \text{Span}(S \setminus \{v\})$ .

*Proof.* 2. follows from the negation of 1.

( $\Longrightarrow$ ) Suppose S linearly dependent. Then,  $0_V = \sum_{i=1}^n a_i v_i$  for some nontrivial linear combination of distinct vectors S. At least one of  $a_i \ne 0$ ; we can assume wlog (reindexing)  $a_1 \ne 0$ . Then,

$$a_1v_1 = -\sum_{i=2}^n a_iv_i \implies v_1 = (-a_1^{-1})\sum_{i=2}^n a_iv_i = \sum_{i=2}^n (-a_1^{-1}a_i)v_i,$$

hence,  $v_1 \in \operatorname{Span}(\{v_2, \dots, v_n\}) \subseteq \operatorname{Span}(S \setminus \{v\})$ 

 $(\longleftarrow)$  Suppose  $v \in \text{Span}(S \setminus \{v\})$ , then  $v = a_1v_1 + \cdots + a_nv_n$ , with  $v_1, \ldots, v_n \in S \setminus \{v\}$ , thus

$$0_V = a_1 v_1 + \cdots a_n v_n - v,$$

which is not a trivial combination (-1 on the v; v cannot "merge" with the other vectors), hence S is linearly dependent.

# **←** Corollary 1.1

§1.4

 $S \subseteq V$  is linearly independent  $\iff S$  a minimal spanning set of Span S.

*Proof.* Follows from proposition 1.4, 2.

#### → Definition 1.9: Maximally Independent

Let V be a vector space over a field  $\mathbb{F}$ . A set  $S \subseteq V$  is called *maximally independent* if S is linearly independent and  $\nexists v \in V \setminus S$  s.t.  $S \cup \{v\}$  is still linearly independent.

In other words, there is no proper supset  $\tilde{S} \supseteq S$  that is still independent.

#### → Lemma 1.3

If  $S \subseteq V$  maximally independent, then S is spanning for V.

<u>Proof.</u> Let  $S \subseteq V$  be maximally independent. Let  $v \in V$ ; supposing  $v \notin S$  (in the case that  $v \in S$ , then  $v \in S$  (in the case that  $v \in S$ , then  $v \in S$ ) trivially). By maximality,  $S \cup \{v\}$  is linearly dependent, hence there exists a nontrivial linear combination that equals  $v \in S$  independent, this combination must include v, with a nonzero coefficient. We can write

$$av + \sum_{i=1}^{n} a_i v_i = 0_V \quad a \neq 0, v_i \in S$$

$$\implies v = \sum_{i=1}^{n} (-a^{-1}a_i)v_i \in \operatorname{Span} S.$$

#### $\hookrightarrow$ Theorem 1.1

Let *V* be a vector space over a field  $\mathbb{F}$  and let  $S \subseteq V$ . TFAE:

- 1. *S* is a minimal spanning set;
- 2. *S* is linearly independent and spanning;
- 3. *S* is a maximally linearly independent set;
- 4. Every vector in *V* is equal to *unique* linear combination of vectors in *S*.

← Lecture 04; Last Updated: Mon Mar 25 13:48:03 EDT 2024

*Proof.* (1.  $\implies$  2.) Suppose *S* is spanning for *V* and is minimal. Then, by corollary 1.1, we have that *S* is linearly independent, and is thus both linearly independent and spanning.

(2.  $\implies$  3.) Suppose *S* is linearly independent and spanning. Let  $v \in V \setminus S$ ; *S* is spanning, hence  $v \in \operatorname{Span} S$ , that is, there exists a linear combination of vectors in *S* that is equal to v:

$$v=a_1v_1+\cdots+a_nv_n, a_i\in\mathbb{F}, v_i\in S.$$

Thus,  $0_V = a_1v_1 + \cdots + a_nv_n - v$ , thus  $S \cup \{v\}$  is linearly dependent, and so S is maximally linearly independent.

- (3.  $\implies$  1.) Suppose *S* is maximally linearly independent. By lemma 1.3, *S* is spanning, and since *S* is linearly independent, by corollary 1.1, *S* is minimally spanning for Span *S*.
- (2.  $\implies$  4.) Suppose *S* is linearly independent and spans *V*, and let  $v \in V$ . We have that  $v \in \text{Span } S$  and hence is equal to a linear combination of vectors in *S*. This gives existence; we now need to prove uniqueness.

Suppose there exist two linear combinations that equal *v*,

$$v = a_1v_1 + \cdots + a_nv_n = b_1u_1 + \cdots + b_mu_m$$

 $a_i, b_j \in \mathbb{F}$ ,  $v_i, u_j \in S$ . With appropriate reindexing/relabelling and allowing certain scalars to equal 0, we can assume that the combinations use the same vectors (with potentially different coefficients), that is,

$$v = a_1 w_1 + \dots + a_k w_k = b_1 w_1 + \dots + a_k w_k.$$

This implies, then,

$$(a_1 - b_1)w_1 + \cdots + (a_k - b_k)w_k = 0_V$$

and by the assumed linear independent of S, each coefficient  $(a_i - b_i) = 0 \,\forall i \implies a_i = b_i \,\forall i$ , hence, these are indeed the same representations, and thus this representation is unique.

(4.  $\implies$  2.) Suppose every vector in V admits a unique linear combination of vectors in S. Clearly, then, S is spanning. It remains to show S is linearly independent. Suppose

$$0_V = a_1 v_1 + \dots + a_n v_n$$

for  $v_i \in S$ . But we have that every vector has a unique representation, and we know that  $a_i = 0 \,\forall i$  is a (valid) linear combination that gives  $0_V$ ; hence, this must be the unique combination,  $a_i = 0 \,\forall i$ , and the linear combination above is trivial. Hence, S is linearly independent and spanning.

#### **→ Definition 1.10: Basis**

If any (hence all) of the above statements hold, we call *S* a *basis* for *V*.

In the words of 4., we call the unique linear combination of vectors in S that is equal to v the unique representation of v in S. Its coefficients are called the Fourier coefficients of v in S.

### **⊗ Example 1.9**

- 1. St<sub>n</sub> = { $e_i$  : 1  $\leq$   $i \leq$  n} is a basis for  $\mathbb{F}^n$ .
- 2. In  $\mathbb{F}^3$ , the set

$$\{(1,0,-1),(0,1,-1),(0,0,1)\}$$

is a basis; it is linearly independent and spanning.

3. For  $\mathbb{F}[t]_n$ , the standard basis is

$$\{1, t, t^2, \dots, t^n\}.$$

4. For  $\mathbb{F}[t]$ , the standard basis is

$$S := \{1, t, t^2, \dots\} = \{t^n : n \in \mathbb{N}\}.$$

5. Let  $\mathbb{F}[[t]]$  denote the space of all formal power series  $\sum_{n\in\mathbb{N}} a_n t^n$ ; polynomials are an example, but with only finite nonzero coefficients. Note that, then, the set S defined above is not a basis for this "extended" set. We *can* in fact find a basis for this set; we need more tools first.

#### **←** Theorem 1.2

Every vector space has a basis.

**Remark 1.6.** This theorem relies on assuming the Axiom of Choice.

← Lecture 05; Last Updated: Mon Mar 25 13:48:03 EDT 2024

*Proof (Attempt).* (Of theorem 1.2) We will try to "inductively" build a maximally independent set, as follows:

Begin with an empty set  $S_0 := \emptyset$ , and iteratively add more vectors to it. Let  $v_0 \in V$  be a non-zero vector, and let  $S_1 := \{v_0\}$ .

If  $S_1$  is maximal, then we are done. Otherwise, there exists a new vector  $v_1 \in V \setminus S_1$  s.t.  $S_2 := \{v_0, v_1\}$  is still independent.

If  $S_2$  is maximal, then we are done. Otherwise, there exists a new vector  $v_2 \in V \setminus S_2$  s.t.  $S_3 := \{v_0, v_1, v_2\}$  is still independent.

Continue in this manner; this would take arbitrarily many finite, or even infinite, steps; we would need some "choice function" that would "allow" us to choose any particular ith vector  $v_i$ .

We can make this construction precise via the Axiom of Choice and transfinite induction (on ordinals); alternatively, we will prove a statement equivalent to the Axiom of Choice, Zorn's Lemma.

**Remark 1.7.** Before stating Zorn's Lemma, we introduce the following terminology.

### $\hookrightarrow$ **Axiom** 1.1: Axiom of Choice

Let X be a set of nonempty sets. Then, there exists a choice function f defined on X that maps each set of X to an element of that set.

#### → Definition 1.11: Inclusion-Maximal Element

A *inclusion-maximal* element of *I* is a set  $S \in I$  s.t. there is no strict super set  $S' \supseteq S$  s.t.  $S' \in I$ .

### **→ Definition 1.12: Chain**

Let *X* a set. Call a collection  $C \subseteq \mathcal{P}(X)$  a *chain* if any two  $A, B \in C$  are comparable, ie,  $A \subseteq B$  or  $B \subseteq A$ .

#### → Definition 1.13: Upper Bound

An *upper bound* of a collection  $\tau \subseteq \mathcal{P}(X)$  is a set  $U \subseteq X$  s.t.  $U \supseteq J \forall J \in \tau$ ; U contains the union of all sets in J.

#### **® Example 1.10: Of The Previous Definitions**

Let  $X := \mathbb{N}, I := \{\emptyset, \{0\}, \{1, 2\}, \{1, 2, 3\}\} \subseteq \mathcal{P}(\mathbb{N}).$ 

The maximal elements of I would be  $\{0\}$  and  $\{1,2,3\}$ .

Chains would include  $C_0 := \{\emptyset, \{1,2\}, \{1,2,3\}\}, C_1 := \{\emptyset, \{0\}\}, C_2 := \{\emptyset\}$  (or any set containing a single element).

The sets  $\{0,1,2,3\}$  and  $\{0,1,2,3,4,5\}$  are upper bounds for I, while neither is an element of I. The set  $\{1,2,3\}$  is an upper bound for  $C_0$ . A chain  $\{\emptyset, \{0\}, \{0,1\}, \{0,1,2\}, \dots\}$  has an upper bound of  $\mathbb{N}$ .

#### → Lemma 1.4: Zorn's Lemma

Let X be an ambient set and  $I \subseteq \mathcal{P}(X)$  be a nonempty collection of subsets of X. If every chain  $C \subseteq I$  has an upper bound in I, then I has a maximal element.

"Proof". This is equivalent to the Axiom of Choice; proving it is beyond the scope of this course :(.

*Proof of theorem 1.2, cnt'd.* We obtain a maximal independent set using Zorn's Lemma.

Let I be the collection of all linearly independent subsets of V. I is nonempty;  $\emptyset \in I$ , as is  $\{v\} \in I$  for any nonzero  $v \in V$ . To apply Zorn's, we need to show that every chain C if sets in I has an upper bound in I; that is, every linearly independent set has an upper bound that itself is linearly independent.

Let C be a chain in I. Let  $S := \bigcup C$  be the union of all sets in C. To show S is linearly independent, it suffices to show that every finite subset  $\{v_1, \ldots, v_n\} \subseteq S$  is linearly independent. Let  $S_i \in C$  be s.t.  $v_i \in S_i$  for each i. Because C a chain, for each i, j we have either  $S_i \subseteq S_j$  or  $S_j \subseteq S_i$ , and so we can order  $S_1, \ldots, S_n$  in increasing order w.r.t  $\subseteq$ . This implies, then, there is a maximal  $S_{i_0}$  s.t.  $S_{i_0} \supseteq S_i \ \forall \ i \in \{1, \ldots, n\}$ . Moreover, we have that  $\{v_1, \ldots, v_n\} \in S_{i_0}$ , and that  $S_{i_0}$  is linearly independent and thus  $\{v_1, v_2, \ldots, v_n\}$  is also linearly independent.

Thus, as we can apply Zorn's Lemma, we conclude that I has a maximal element, ie, there is a maximal independent set, and thus a V indeed has a basis.

← Lecture 06; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### $\hookrightarrow$ Theorem 1.3

For every vector space V over a field  $\mathbb{F}$ , any two bases  $\mathcal{B}_1$ ,  $\mathcal{B}_2$  are equinumerous/of equal size/cardinality, ie, there is a bijection between  $\mathcal{B}_1$  and  $\mathcal{B}_2$ .

**Remark 1.8.** We will only prove this for vector spaces that admit a finite basis.

#### **→ Lemma** 1.5: Steinitz Substitution

Let *V* be a vector space over a field  $\mathbb{F}$ . Let  $Y \subseteq V$  be a (possibly infinite) linearly independent set and let  $Z \subseteq V$  be a finite spanning set. Then:

- 1.  $k := |Y| \le |Z| =: n$
- 2. There is  $Z' \subseteq Z$  of size n k s.t.  $Y \cup Z'$  is still spanning.

<u>Proof.</u> Remark first that if Z finite and spanning for V, then we cannot have a infinite linearly independent Y subset of V. Thus, wlog assume that Y finite.

We prove by induction on k.

k = 0 gives that  $Y = \emptyset$ , and so Z' = Z itself works  $(Z' \cup Y = Z)$  as a spanning set.

Suppose the statement holds for some  $k \ge 0$ . Let Y be an independent set such that |Y| = k + 1, ie

$$Y := \{y_1, y_2, \dots, y_k, y_{k+1}\}, y \in V.$$

By our inductive assumption, we can consider  $Y' := \{y_1, \dots, y_k\} \subseteq Y$  of size k, to obtain a set

$$Z' = \{z_1, z_2, \dots, z_{n-k}\} \subseteq Z$$
, s.t.  $Y' \cup Z' = \{y_1, \dots, y_k, z_1, \dots, z_{n-k}\}$ 

is spanning. As this is spanning, we can write  $y_{k+1}$  as a linear combination of vectors in  $Y' \cup Z'$ , ie

$$y_{k+1} = a_1 y_1 + \dots + a_k y_k + b_1 z_1 + \dots + b_{n-k} z_{n-k}, \quad a_i, b_j \in \mathbb{F}.$$

It must be that at least one of  $b_j$ 's must be nonzero; if they were all zero, then  $y_{k+1}$  would simply be a linear combination of vector  $y_i$  giving that  $y_{k+1}$  linearly dependent, contradicting our construction of Y linearly independent.

Assume, wlog,  $b_{n-k} \neq 0$ . Then, we can write

$$z_{n-k} = b_{n-k}^{-1} y_{k+1} - b_{n-k}^{-1} a_1 y_1 - \dots - b_{n-k}^{-1} a_k y_k - b_{n-k}^{-1} b_1 z_1 - \dots - b_{n-k}^{-1} b_{n-k-1} z_{n-k-1},$$

and hence

$$z_{n-k} \in \text{Span}\{y_1, \dots, y_{k+1}, z_1, \dots, z_{n-k-1}\} = \text{Span}\left(\underbrace{\{y_1, \dots, y_{k+1}\}}_{Y} \cup \underbrace{\{z_1, \dots, z_{n-k-1}\}}_{:=Z''}\right).$$

We had that  $Y' \cup Z'$  was spanning, and  $(Y' \cup Z') \setminus (Y \cup Z'') = \{z_{n-k}\} \subseteq \operatorname{Span}(Y \cup Z'')$ , and we thus have that  $Y \cup Z''$  is also spanning.

## **Corollary 1.2:** Finite Basis Case for theorem 1.3

Let *V* be a vector space that admits a finite basis. Then, any two bases of *V* are equinumerous.

*Proof.* Let *Y* , *Z* be two finite bases for *V* . Then, *Y* is independent and *Z* is spanning, so by Steinitz Substitution,  $|Y| \le |Z|$ . OTOH, *Z* is independent, and *Y* is spanning, so by Steinitz Substitution,  $|Z| \le |Y|$ , and we conclude that |Y| = |Z|. Let n := |Y|.

It remains to show that there exist no infinite bases for V; it suffices to show that there is no independent set of size n + 1. To this end, let  $I \subseteq V$  such that |I| = n + 1 be an independent set. Y is still spanning, hence, by the substitution lemma,  $n + 1 \le n$ , a contradiction. Hence, I as defined cannot exist and so any basis of V must be of size n.

#### **→ Definition 1.14: Dimension**

Let *V* be a vector space over a field  $\mathbb{F}$  . The *dimension* of *V*, denote

dim(V)

as the cardinality/size of any basis for V. We call V finite dimensional if  $\dim(V)$  is a natural number, i.e. V admits a finite basis. Otherwise, we say V is infinite dimensional.

### ← Corollary 1.3: of Steinitz Substitution

Let *V* be a finite dimensional vector space over  $\mathbb{F}$  and denote  $n := \dim(V)$ . Then:

- 1. Every linearly independent subset  $I \subseteq V$  has size  $\leq n$ ;
- 2. Every spanning set  $S \subseteq V$  for V has size  $\ge n$ ;
- 3. Every independent set *I* can be completed to a basis to *V*, ie, there exists a basis *B* for *V* s.t.  $I \subseteq B$ .

*Proof.* Fix a basis B for V, |B| =: n.

- 1. If *I* is a independent set, then because *B* spanning, Steinitz Substitution gives  $|I| \leq |B|$ .
- 2. If *S* spanning for *V*, then because *B* is linearly independent, Steinitz Substitution gives  $|B| \leq |S|$ .
- 3. Let *I* be an independent set. Then, because *B* is spanning, Steinitz Substitution gives  $B' \subseteq B$  of size n |I| s.t.  $I \cup B'$  is spanning. Moreover,  $|I \cup B'| \le n$ , and by 2. it must have size  $\ge n$ , and thus has size precisely n and is thus a minimally spanning set and thus a basis.

# **←** Corollary 1.4: Monotonicity of Dimension

Let *V* be a vector space over a field  $\mathbb{F}$ . For any subspace  $W \subseteq$ , dim  $W \leq$  dim *V*, and

 $\dim W = \dim V \iff W = V.$ 

<u>Proof.</u> Let  $B \subseteq W$  be a basis for W. Because B is independent,  $|B| \leq \dim(V)$  by 1. of corollary 1.3, so  $\dim(W) = |B| \leq \dim(V)$ .

If  $|B| = \dim(V)$ , then B is a basis for V again by 1. of corollary 1.3, so  $W = \operatorname{Span}(B) = V$ .

← Lecture 07; Last Updated: Mon Mar 25 13:48:03 EDT 2024

# 2 LINEAR TRANSFORMATIONS, MATRICES

### 2.1 Definitions

#### **→ Definition 2.1: Linear Transformation**

Let V, W be vector spaces over a field  $\mathbb{F}$ . A function  $T: V \to W$  is called a *linear transformation* if it preserves the vector space structures, that is,

- 1.  $T(v_0 + v_1) = T(v_0) + T(v_1), \forall v_0, v_1 \in V$ ;
- 2.  $T(\alpha \cdot v) = \alpha \cdot T(v), \forall \alpha \in \mathbb{F}, v \in V;$
- 3.  $T(0_V) = 0_W$ .

**Remark 2.1.** *Note that 3. is redundant, implied by 2., but included for emphasis:* 

$$T(0_V) = T(0_{\mathbb{F}} \cdot 0_V) = 0_{\mathbb{F}} \cdot T(0_V) = 0_W.$$

## **® Example 2.1: Linear Transformations**

- 1.  $T: \mathbb{F}^2 \to \mathbb{F}^2$ ,  $T(a_1, a_2) := (a_1 + 2a_2, a_1)$ .
- 2. Let  $\theta \in \mathbb{R}$ , and let  $T_{\theta} : \mathbb{R}^2 \to \mathbb{R}^2$  be the rotation by  $\theta$ . The linearity of this is perhaps most obvious in polar coordinates, ie  $v \in \mathbb{R}^2$ ,  $v = r(\cos \alpha, \sin \alpha)$  for appropriate  $r, \alpha$ , and  $T_{\theta}(v) = r(\cos(\alpha + \theta), \sin(\alpha + \theta))$ .
- 3.  $T: \mathbb{R}^2 \to \mathbb{R}^2$ , a reflection about the *x*-axis, ie, T(x,y) = (x,-y).
- 4. Projections,  $T: \mathbb{F}^n \to \mathbb{F}^n$ .
- 5. The transpose on  $M_n(\mathbb{F})$ , ie,  $T: M_n(\mathbb{F}) \to M_n(\mathbb{F})$ , where  $A \mapsto A^t$ .
- 6. The derivative on space of polynomials of degree leq n,  $D : \mathbb{F}[t]_{n+1} \to \mathbb{F}[t]_n$ ,  $p(t) \mapsto p'(t)$ .

#### $\hookrightarrow$ Theorem 2.1

Linear transformations are completely determined by their values on a basis.

That is, let  $\mathcal{B} := \{v_1, \dots, v_n\}$  be a basis for a vector space V over  $\mathbb{F}$ . Let W also be a vector space over  $\mathbb{F}$  and let  $w_1, \dots, w_n \in W$  be arbitrary vectors. Then, there is a unique linear transformation  $T: V \to W$  s.t.  $T(v_i) = w_i \, \forall \, i = 1, \dots, n$ .

*Proof.* We aim to define T(v) for arbitrary  $v \in V$ . We can write

$$v = a_1v_1 + \cdots + a_nv_n$$

as the unique representation of v in terms of the basis  $\mathcal{B}$ . Then, we simply define

$$T(v) := a_1 w_1 + \cdots + a_n w_n,$$

for our given  $w_i$ 's. Then,  $T(v_i) = 1 \cdot w_i = w_i$ , as desired, and T is linear;

1. Let  $u, v \in V$ ;  $u := \sum_{n} a_i v_i, v := \sum_{n} b_i v_i$ . Then,

$$T(u+v) = T(\sum_{i=1}^{n} a_i v_i + \sum_{i=1}^{n} b_i v_i) = T(\sum_{i=1}^{n} (a_i + b_i) v_i) = \sum_{i=1}^{n} (a_i + b_i) w_i = \sum_{i=1}^{n} a_i w_i + \sum_{i=1}^{n} b_i w_i = T(u) + T(v).$$

2. Scalar multiplication follows similarly.

To show uniqueness, suppose  $T_0$ ,  $T_1$  are two linear transformations satisfying  $T_0(v_i) = w_i = T_1(v_i)$ . Let  $v \in V$ , and write  $v = \sum_n a_i v_i$ . By linearity,

$$T_k(v) = T_k(\sum_n a_i v_i) = \sum_n a_i T(v_i) = \sum_n a_i w_i,$$

for k = 0, 1, hence,  $T_1(v) = T_0(v)$  for arbitrary v, hence the transformations are equivalent.

## **○** <u>Definition</u> 2.2: Some Important Transformations

We denote  $T_0: V \to W$  by  $T_0(v) := 0_W \forall v \in V$  the zero transformation. We denote  $I_V: V \to V$ ,  $I_V(v) := v \forall v \in V$ , as the identity transformation.

← Lecture 08; Last Updated: Mon Mar 25 13:48:03 EDT 2024

# 2.2 Isomorphisms, Kernel, Image

# **→ Definition 2.3: Isomorphism**

Let V, W be vector spaces over  $\mathbb{F}$ . An *isomorphism* from V to W is a linear transformation  $T:V\to W$  (a homomorphism for vector spaces) which admits an inverse  $T^{-1}$  that is also linear.

If such an isomorphism exists, we say *V* and *W* are *isomorphic*.

#### **→ Proposition 2.1**

 $T: V \to W$  is an isomorphism  $\iff T$  is linear and bijective.

*Proof.* The direction  $\implies$  is trivial.

Suppose  $T:V\to W$  is linear and bijective, ie  $T^{-1}$  exists. We need to show that  $T^{-1}$  is linear. Let  $w_1,w_2\in W, a_1,a_2\in \mathbb{F}$ . Then:

$$T^{-1}(a_1w_1 + a_2w_2) = T^{-1}(a_1T(T^{-1}(w_1)) + a_2T(T^{-1}(w_2)))$$
(by linearity of  $T$ ) 
$$= T^{-1}(T(a_1T^{-1}(w_1) + a_2T^{-1}(w_2)))$$

$$= a_1T^{-1}(w_1) + a_2T^{-1}(w_2).$$

**Remark 2.2.** This proposition holds for all structures that only have operations; it does not for those with relations, such as graphs, orders, etc..

#### $\hookrightarrow$ Theorem 2.2

For  $n \in \mathbb{N}$ , every n-dimensional vector space V over  $\mathbb{F}$  is isomorphic to  $\mathbb{F}^n$ . In particular, all n-dim vector spaces over  $\mathbb{F}$  are isomorphic.

<u>Proof.</u> Fix a basis  $\mathcal{B} := \{v_1, \dots, v_n\}$  for V, and let  $T: V \to \mathbb{F}^n$  be the unique linear transformation determined by  $\overline{\mathcal{B}}$  with  $T(v_i) = e_i$ , where  $\{e_1, \dots, e_n\}$  is the standard basis for  $\mathbb{F}^n$ . We show that T is a bijection.

(Injective) Suppose  $T(x) = T(y), x, y \in V$ . Write  $x = a_1v_1 + \cdots + a_nv_n, y = b_1v_1 + \cdots + b_nv_n$ , the unique representation of x, y in the basis  $\mathcal{B}$ . We have:

$$a_1e_1 + \cdots + a_ne_n = a_1T(v_1) + \cdots + a_nT(v_n) = T(a_1v_1 + \cdots + a_nv_n) = T(x) = T(y) = \cdots = b_1e_1 + \cdots + b_ne_n$$

but by the uniqueness of representation in a basis, it follows that each  $a_i = b_i$ , hence, x = y.

(Surjective) Let  $w \in \mathbb{F}^n$ . Then,  $w = a_1e_1 + \cdots + a_ne_n$  (uniquely). But then,

$$w = a_1 T(v_1) + \cdots + a_n T(v_n) = T(a_1 v_1 + \cdots + a_n v_n),$$

where  $a_1v_1 + \cdots + a_nv_n \in V$ , hence T indeed surjective.

**Remark 2.3.** Replacing  $\mathbb{F}^n$  with an arbitrary n-dim vector space W over  $\mathbb{F}$  yields the following.

### **←** Theorem 2.3: Freeness of Vector Spaces

Let W, V be vector spaces over  $\mathbb{F}$  and let  $\beta$ ,  $\gamma$  be bases for V, W respectively. Every bijection  $T: \beta \to \gamma$  can be extended to an isomorphism  $\hat{T}: V \to W$ .

In particular, all vector spaces over  $\mathbb{F}$  with equinumerous bases are isomorphic.

**Remark 2.4.** The proof follows very similarly to the previous theorem, but extended to arbitrary, possible infinite, spaces.

*Proof.* Homework exercise.

#### → Definition 2.4: Image/Kernel

For a linear transformation  $T: V \to W$ , where V, W are vector spaces over  $\mathbb{F}$ , we define the *image* 

$$Im(T) := T(V),$$

and its kernel

$$Ker(T) = T^{-1}(\{0_W\}).$$

### $\hookrightarrow$ Proposition 2.2

Ker(T) and Im T are subspaces of V, W resp.

*Proof.* (Ker(T)) Let  $v_0, v_1 \in \text{Ker } T$  and  $a_0, a_1 \in \mathbb{F}$ , then

$$T(a_0v_0+a_1v_1)=a_0T(v_0)+a_1T(v_1)=0_W \implies a_0v_0+a_1v_1 \in \operatorname{Ker} T.$$

 $(\operatorname{Im}(T))$  Let  $w_0, w_1 \in \operatorname{Im} T$ ,  $a_0, a_1 \in \mathbb{F}$ . Then  $w_i = T(v_i), v_i \in V$ , and so

$$a_0w_0 + a_1w_1 = a_0T(v_0) + a_1T(v_1) = T(a_0v_0 + a_1v_1) \implies a_0w_0 + a_1w_1 \in \operatorname{Im} T.$$

# $\hookrightarrow$ Proposition 2.3

Let  $T: V \to W$  be a linear transformation, where V, W vector spaces over  $\mathbb{F}$ . Let  $\beta$  be a (possibly infinite) basis for V. Then,  $T(\beta)$  spans Im(T).

In particular, T is surjective iff  $T(\beta)$  spans W.

*Proof.* Let  $w \in \text{Im}(T)$ , so w = T(v) for some  $v \in V$ , where we have  $v := a_1v_1 + \cdots + a_nv_n$ ,  $v_i \in \beta$ . Then,

$$w = T(v) = a_1 T(v_1) + \dots + a_n T(v_n) \in \operatorname{Span}(\{T(v_1), \dots, T(v_n)\}) \subseteq \operatorname{Span}(T(\beta)).$$

← Lecture 09: Last Uvdated: Mon Mar 25 13:48:03 EDT 2024

### **→** Proposition 2.4

Let  $T: V \to W$  be a linear transformation, where V, W vector spaces over  $\mathbb{F}$ . TFAE:

- 1. *T* is injective.
- 2. Ker(T) is the trivial subspace  $\{0_V\}$ .
- 3.  $T(\beta)$  is independent for each basis  $\beta$  for V.
- 3'.  $T(\beta)$  is independent for some basis  $\beta$  for V.

*Proof.* (1.  $\implies$  2.) Trivial; only  $0_V$  can be mapped to  $0_W$ .

(2.  $\Longrightarrow$  1.) Suppose  $Ker(T) = \{0_V\}$  and let T(x) = T(y),  $x, y \in V$ . By linearity,

$$T(x-y) = T(x) - T(y) = 0_W \implies x-y \in \operatorname{Ker}(T) \implies x-y = 0_V \implies x = y.$$

(2.  $\Longrightarrow$  3.) Fix a basis  $\beta$  for V. To show that  $T(\beta)$  linearly independent, take an arbitrary linear combination  $a_1w_1 + \cdots + a_nw_n \in T(\beta)$ . Suppose  $\sum_i a_iw_i = 0_W$ . Since  $w_i \in T(\beta)$ ,  $w_i = T(v_i)$ ,  $v_i \in \beta$ , hence

$$0_W = a_1 w_1 + \dots + a_n w_n = a_1 T(v_1) + \dots + a_n T(v_n) = T(a_1 v_1 + \dots + a_n v_n)$$

$$\implies a_1 v_1 + \dots + a_n v_n \in \text{Ker}(T)$$

$$\implies a_1 v_1 + \dots + a_n v_n = 0_V,$$

but each  $v_i$  is linearly independent, hence this must be a trivial linear combination, and thus  $a_i = 0 \,\forall i$ .

- (3)  $\implies$  (3') Trivial; stronger statement implies weaker statement.
- $(3') \Longrightarrow (2)$  Suppose  $T(\beta)$  linearly independent for some basis  $\beta$  for V. Suppose  $T(v) = 0_W$ ,  $v \in V$ . We write

$$v = a_1v_1 + \cdots + a_nv_n, v_i \in \beta.$$

Then,

$$0_W = T(v) = T(a_1v_1 + \dots + a_nv_n) = a_1T(v_1) + \dots + a_nT(v_n),$$

but  $\{T(v_i)\}\subseteq T(\beta)$  is linearly independent, hence, this combination must be trivial and each  $a_i=0$ , and thus  $v=0_V$  and so  $Ker(T)=\{0_V\}$  is trivial.

### → Definition 2.5: Rank, nullity

Let V, W be vector spaces over  $\mathbb{F}$  and  $T:V\to W$  be linear. Define *rank* of T as

$$rank(T) := dim(Im(T)),$$

and *nullity* of *T* as

$$nullity(T) := dim(Ker(T)).$$

#### → Theorem 2.4: Rank-Nullity Theorem

Let V, W be vector spaces over  $\mathbb{F}$ ,  $\dim(V) < \infty$ . Let  $T : V \to W$  be a linear transformation. Then,

$$\operatorname{nullity}(T) + \operatorname{rank}(T) = \dim(V).$$

**Remark 2.5.** Intuitively: the nullity is the number of vectors we "collapse"; the rank is what is left. Together, we have the entire space.

**Remark 2.6.** This follows directly from the first isomorphism theorem for vector spaces, and the fact that  $\dim(V/\ker(T)) = \dim(V) - \dim(\ker(T))$ ; however, we will prove it without this result below.

*Proof.* Let  $\{v_1, \ldots, v_k\}$  be a basis for Ker(T), and complete it to a basis  $\beta := \{v_1, \ldots, v_k, u_1, \ldots, u_{n-k}\}$  for V, where  $n := \dim(V)$ . We need to show that  $\dim(Im(T)) = n - k$ .

Recall that  $\{T(v_1), \ldots, T(v_k), T(u_1), \ldots, T(u_{n-k})\}$  spans  $\operatorname{Im}(T)$ . But  $v_1, \ldots, v_k \in \operatorname{Ker}(T)$ , so  $T(v_i) = 0_W \ \forall i = 1, \ldots, k$ . Hence, letting  $\gamma := \{T(u_1), \ldots, T(u_{n-k})\}$  spans  $\operatorname{Im}(T)$ . It remains to show that  $\gamma$  is independent.

Let  $a_1T(u_1) + \cdots + a_{n-k}T(u_{n-k}) = 0_W$ ; by linearity,

$$T(a_1u_1 + \dots + a_{n-k}u_{n-k}) = 0_W$$

$$\implies a_1u_1 + \dots + a_{n-k}u_{n-k} \in \text{Ker}(T)$$

$$\implies a_1u_1 + \dots + a_{n-k}u_{n-k} = b_1v_1 + \dots + b_kv_k,$$

but each of these  $u_i, v_j \in \beta$ , hence, each coefficient must be identically zero as  $\beta$  linearly independent, and thus  $\dim(\operatorname{Im}(T)) = n - k$ . This completes the proof.

# 

Let  $T: V \to W$  be a linear transformation. If T injective, then  $\dim(W) \ge \dim(V)$ .

*Proof.* If dim(V) < ∞, then dim(Im(T)) = dim(V), and we have that dim(Im(T)) ≤ dim(W) and conclude  $\overline{\dim}(V) \le \dim(W)$ .

If  $\dim(V) = \infty$ , then  $\dim(\operatorname{Im}(T)) = \infty$  and  $\dim(W) \ge \dim(\operatorname{Im}(T)) = \infty$ .

### **←** Corollary 2.2

Let  $n \in \mathbb{N}$  and V, W be n-dimensional vector spaces over  $\mathbb{F}$ . For a linear transformation  $T: V \to W$ , TFAE:

- 1. *T* injective;
- 2. T surjective;
- 3. rank(T) = n.

*Proof.* (2.  $\iff$  3.) Follows from rank $(T) = \dim(\operatorname{Im}(T)) = n \iff \operatorname{Im}(T) = W$ .

(1.  $\implies$  3.) We have nullity(T) = 0 so rank(T) = dim(V) = n.

(3.  $\implies$  1.) If rank(T) = n, then nullity(T) = 0.

← Lecture 10; Last Updated: Mon Mar 25 13:48:03 EDT 2024

### **— Theorem** 2.5: First Isomorphism Theorem for Vector Spaces

Let V, W be vector spaces over  $\mathbb{F}$ . Let  $T: V \to W$  be a linear transformation. Then,

$$V/\mathrm{Ker}(T) \cong \mathrm{Im}(T)$$
,

by the isomorphism given by  $v + \text{Ker}(T) \mapsto T(v)$ .

<u>Proof.</u> From group theory, we know that  $\hat{T}: V/\mathrm{Ker}(T) \to \mathrm{Im}(T)$ , where  $\hat{T}(v + \mathrm{Ker}(T)) := T(v)$  is well-defined, and is an isomorphism of abelian groups. We need only to check that  $\hat{T}$  is linear, namely, that is respects scalar multiplication. We have

$$\hat{T}(a \cdot (v + \text{Ker}(T))) = \hat{T}((a \cdot v) + \text{Ker}(T))$$
$$= T(av) = a \cdot T(v)$$
$$= a\hat{T}(v + \text{Ker}(T)),$$

as desired.

# **2.3** The Space Hom(V, W)

### → Definition 2.6: Homomorphism Space

For vector spaces V, W over  $\mathbb{F}$ , let Hom(V,W) (also denoted  $\ell(V,W)$ ) denote the set of all linear transformations from V to W. We can turn this into a vector space over  $\mathbb{F}$  as follows:

1. Addition of linear transformations: for  $T_0, T_1 \in \text{Hom}(V, W)$ , define

$$(T_0 + T_1): V \to W, \quad v \mapsto T_0(v) + T_1(v).$$

 $(T_0 + T_1)$  is clearly a linear transformation, as the linear combination of linear transformations  $T_0$ ,  $T_1$ .

2. Scalar multiplication of linear transformations: for  $T \in \text{Hom}(V, W)$ ,  $a \in \mathbb{F}$ , define

$$(a \cdot T) : V \to W, \quad v \mapsto a \cdot T(v),$$

which is again clearly linear in its own right.

### **← Proposition 2.5**

Endowed with the operations described above, Hom(V, W) is a vector space over  $\mathbb{F}$ .

*Proof.* Follows easily from the definitions.

## $\hookrightarrow$ Theorem 2.6: Basis for Hom(V, W)

For vector spaces V, W over  $\mathbb{F}$  and bases  $\beta$ ,  $\gamma$  for V, W resp., the following set

$$\{T_{v,w}=v\in\beta,w\in\gamma\},$$

is a basis for  $\operatorname{Hom}(V, W)$ , where for each  $v \in \beta$  and  $w \in \gamma$ ,  $T_{v,w} \in \operatorname{Hom}(V, W)$  defined as the unique linear transformation such that

$$T_{v,w}(v') = \begin{cases} w & v' = v \\ 0_W & v' \neq v \iff \in \beta \setminus \{v\} \end{cases}.$$

Proof. Left as a (homework) exercise.

# **←** Corollary 2.3

If V, W finite dimensional, then  $\dim(\operatorname{Hom}(V,W)) = \dim(V) \cdot \dim(W)$ .

### **→ Proposition 2.6**

Let  $\beta = \{v_1, \dots, v_n\}$ ,  $\gamma = \{w_1, \dots, w_m\}$  be bases for V, W resp. Then, by theorem 2.6,

$$\{T_{v_i,w_j}: i \in \{1,\ldots,n\}, j \in \{1,\ldots,m\}\}$$

is a basis for Hom(V, W), and it has  $n \cdot m$  vectors by construction.

# 2.4 Matrix Representation of Linear Transformations, Finite Fields

Consider a linear transformation  $T: \mathbb{F}^n \to \mathbb{F}^m$  between finite fields. We know that T is uniquely determined by its value of basis vectors, so fix the standard bases

$$\beta = \{e_1^{(n)}, \dots, e_n^{(n)}\} = \{v_1, \dots, v_n\},\$$

and note that *T* is determined by  $\{T(v_1), \ldots, T(v_n)\} \subseteq \mathbb{F}^m$ .

**Remark 2.7.** We denote vectors in  $\mathbb{F}^n$  as column vectors, ie  $\begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix} \in \mathbb{F}^n$ .

Each  $T(v_i)$  is a column vector in  $\mathbb{F}^m$ , and we an put these into a  $m \times n$  matrix, namely:<sup>7</sup>

$$[T] := \begin{pmatrix} | & & | \\ T(v_1) & \cdots & T(v_n) \\ | & & | \end{pmatrix} = \underbrace{\begin{pmatrix} a_{11} & \cdots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{m1} & \cdots & a_{mn} \end{pmatrix}}_{r}$$

We call this the *matrix representation* of T in the standard bases. The operation of multiplying an  $m \times n$  matrix and a  $n \times 1$  vector is precisely defined so that

 $\hookrightarrow$  Proposition 2.7

 $T(v) = [T] \cdot v \text{ for all } v \in \mathbb{F}^n.$ 

<sup>7</sup>Where [T] denotes a matrix named "T".

Proof. Let 
$$v = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix}$$
, where  $v = x_1 v_1 + \dots + x_n v_n$ . Then

$$T(v) = x_1 T(v_1) + \dots + x_n T(v_n)$$

$$T(v_i) = \begin{pmatrix} a_{1i} \\ \vdots \\ a_{mi} \end{pmatrix}$$

so

$$T(v) = \begin{pmatrix} a_{11} \cdot x_1 + \dots + a_{1n} \cdot x_n \\ & \ddots \\ a_{m1} \cdot x_1 + \dots + a_{mn} \cdot x_n \end{pmatrix} = [T] \cdot v$$

#### **○→ Definition 2.7**

For a given  $m \times n$  matrix A over  $\mathbb{F}$ , define  $L_A : \mathbb{F}^n \to \mathbb{F}^m$  by  $L_A(v) := A \cdot v$ , where v is viewed as an  $n \times 1$  column. It follows from definition that the  $L_A$  is linear.

In other words, every  $T \in \text{Hom}(\mathbb{F}^n, \mathbb{F}^m)$  is equal to  $L_A$  for some A.

← Lecture 11; Last Updated: Mon Mar 25 13:48:03 EDT 2024

### **→ Proposition 2.8**

The map

$$\operatorname{Hom}(\mathbb{F}^n, \mathbb{F}^m) \to M_{m \times n}(\mathbb{F})$$

$$T \mapsto [T]$$

is an isomorphism of vector spaces, with inverse

$$M_{m \times n}(\mathbb{F}) \to \operatorname{Hom}(\mathbb{F}^n, \mathbb{F}^m)$$
  
 $A \mapsto L_A.$ 

*Proof.* Linearity: Let  $\beta = \{v_1, \dots, v_n\}$  be the standard basis for  $\mathbb{F}^n$ . Fix  $T_1, T_2 \in \text{Hom}(\mathbb{F}^n, \mathbb{F}^m)$  and  $\alpha \in \mathbb{F}$ .

1.

$$[T_1 + T_2] = \begin{pmatrix} & & | & & | \\ \cdots & (T_1 + T_2)(v_i) & \cdots \end{pmatrix} = \begin{pmatrix} & & | & \\ \cdots & T_1(v_i) + T_2(v_i) & \cdots \end{pmatrix}$$
$$= \begin{pmatrix} & & | & & \\ \cdots & T_1(v_i) & \cdots \end{pmatrix} + \begin{pmatrix} & & | & \\ \cdots & T_2(v_i) & \cdots \end{pmatrix}$$
$$= [T_1] + [T_2]$$

2. It remains to show that  $\alpha \cdot [T] = [\alpha \cdot T]$ ; the proof follows similarly to 1.

<u>Inverse:</u> We need to show that 1.  $A \mapsto L_A \mapsto [L_A]$  is the identity on  $M_{m \times n}(\mathbb{F})$ , and conversely, that 2.  $T \mapsto [T] \mapsto L_{[T]}$  is the identity on  $\text{Hom}(\mathbb{F}^n, \mathbb{F}^m)$ .

- 1. We need to show that  $[L_A] = A$ . The jth column of  $[L_A]$  is  $L_A(v_j) = A \cdot v_j = j$ th column of  $A =: A^{(j)}$ . Hence, the jth column of  $[L_A]$  is equal to the jth column of A, and thus they are equal.
- 2. We showed this in proposition 2.7.

 $\hookrightarrow \underline{\text{Corollary}} \ 2.4$  $\dim(\text{Hom}(\mathbb{F}^n, \mathbb{F}^m)) = \dim(M_{m \times n}(\mathbb{F})) = m \cdot n.$ 

**Remark 2.8.** This was stated previously in proposition 2.6 by constructing an explicit basis. Indeed, this basis is precisely the image of the standard basis for  $M_{m \times n}(\mathbb{F})$  under the map  $A \mapsto L_A$ .

# 2.5 Matrix Representation of Linear Transformations, General Spaces

**Remark 2.9.** The previous section was concerned with representing transformations between finite fields  $\mathbb{F}^n$ ,  $\mathbb{F}^m$ ; this section aims to make the same construction for any finite dimensional V, W.

## **Definition** 2.8: Coordinate Vector

Let V be a finite dimensional space over  $\mathbb{F}$  and let  $\beta := \{v_1, \dots, v_n\}$  be a basis for V. Let  $v \in V$ , with (unique) representation  $v = a_1v_1 + \dots + a_nv_n$ . We denote

$$[v]_{\beta} := \begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix} \in \mathbb{F}^n$$

the *coordinate vector* of v in base  $\beta$ .

**Remark 2.10.** Recall that  $V \cong \mathbb{F}^n$  where  $\dim(V) = n$ , by the unique linear transformation  $v_i \mapsto e_i$ , where  $\{e_1, \dots, e_n\}$  the standard basis for  $\mathbb{F}^n$ . We denote this transformation

$$I_{\beta}:V\to\mathbb{F}.$$

For an arbitrary  $v \in V$ ,  $I_{\beta}(v)$  maps v to its coordinate vector:

$$I_{\beta}(v) = I_{\beta}(a_1v_1 + \dots + a_nv_n) = a_1I_{\beta}(v_1) + \dots + a_nI_{\beta}(v_n)$$
  
=  $a_1e_1 + \dots + a_ne_n = [v]_{\beta}$ .

### **←** Proposition 2.9

The map

$$I_{\beta}: V \to \mathbb{F}^n, \quad v \mapsto [v]_{\beta}$$

is an isomorphism.

Suppose we are given a linear transformation  $T:V\to W$ , where V,W finite dimensional spaces over  $\mathbb{F}$ . Fix  $\beta:=\{v_1,\ldots,v_n\}$  and  $\gamma:=\{w_1,\ldots,w_m\}$  as bases for V,W resp. We can denote  $[T(v_i)]_{\gamma}$  as  $T(v_i)$  in base  $\gamma$  (in the field m), and construct a matrix for T:8

We call this the *matrix representation* of T from  $\beta$  to  $\gamma$ .

#### **←** Theorem 2.7

Let  $T: V \to W$ ,  $\beta$ ,  $\gamma$  as above.

1. The following diagram commutes:

$$\begin{array}{ccc}
\bullet V & \xrightarrow{T} & \bullet W \\
I_{\beta} \downarrow & & \downarrow I_{\gamma} \\
\bullet \mathbb{F}^{n} & \xrightarrow{L_{[T]_{\beta}^{\gamma}}} & \bullet \mathbb{F}^{m}
\end{array}$$

Namely,  $I_{\gamma} \circ T = L_{[T]_{\beta}^{\gamma}} \circ I_{\beta}$ , or equivalently, given  $v \in V$ ,  $[T(v)]_{\gamma} = [T]_{\beta}^{\gamma} \cdot [v]_{\beta}$ .

2. The map  $\operatorname{Hom}(V,W) \to M_{m \times n}(\mathbb{F}), T \mapsto [T]_{\beta}^{\gamma}$  is a vector space isomorphism with inverse begin the map  $M_{m \times n}(\mathbb{F}) \to \operatorname{Hom}(V,W), A \mapsto I_{\gamma}^{-1} \circ L_A \circ I_{\beta}$ 

<sup>&</sup>lt;sup>8</sup>Where we denote  $[T]^{\gamma}_{\beta}$  as the matrix representation of the transform  $T:V\to W$ , with basis  $\beta$ ,  $\gamma$  for V, W respectively.

*Proof.* 2. is left as a (homework) exercise; it follows directly from 1.

Fix  $v \in V$ . We need to show that  $I_{\gamma} \circ T(v) = L_{[T]_{\beta}^{\gamma}} \circ I_{\beta}(v)$ . We have

$$I_{\gamma} \circ T(v) = [T(v)]_{\gamma}.$$

OTOH,

$$L_{[T]^\gamma_\beta}\circ I_\beta(v)=L_{[T]^\gamma_\beta}([v]_\beta)=[T]^\gamma_\beta\cdot [v]_\beta.$$

We need to show, then, that  $[T(v)]_{\gamma} = [T]_{\beta}^{\gamma} \cdot [v]_{\beta}$ . Let  $v = a_1v_1 + \cdots + a_nv_n$ , so  $[v]_{\beta} = \begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix}$ . Recall that

$$[T]_{\beta}^{\gamma} = \begin{pmatrix} | & | \\ [T(v_1)]_{\gamma} & \cdots & [T(v_n)]_{\gamma} \end{pmatrix}$$
. Thus, we have

$$[T]_{\beta}^{\gamma} \cdot [v]_{\beta} = a_1 [T(v_1)]_{\gamma} + \dots + a_n [T(v_n)]_{\gamma} = [a_1 T(v_1) + \dots + a_n T(v_n)]_{\gamma} \quad (by \ linearly \ of \ I_{\gamma})$$

$$= [T(a_1 v_1 + \dots + a_n v_n)]_{\gamma} \quad (by \ linearity \ of \ T)$$

$$= [T(v)]_{\gamma},$$

which is precisely what we wanted to show.

**Remark 2.11.** For  $A \in M_{m \times n}(\mathbb{F})$  and  $x = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} \in \mathbb{F}^n$ , we have

$$A \cdot x = x_1 \cdot A^{(1)} + x_2 \cdot A^{(2)} + \dots + x_n \cdot A^{(n)}$$

where  $A^{(j)}$  is the jth column of A; thus  $A \cdot x$  is a linear combination of A, with coefficients given by the vector x; this interpretation can make it easier to make sense of computations.

← Lecture 12; Last Updated: Mon Mar 25 13:48:03 EDT 2024

# 2.6 Composition of Linear Transformations, Matrix Multiplication

## **→ Proposition 2.10**

Composition is associative; given  $T: V \to W$ ,  $S: W \to U$ , and  $R: U \to X$ , then

$$(R \circ S) \circ T = R \circ (S \circ T).$$

*Proof.* Fix  $v \in V$ . Then

$$(R \circ S) \circ T(v) = (R \circ S)(T(v)) = R(S(T(v)))$$

OTOH:

$$R \circ (S \circ T)(v) = R((S \circ T)(v)) = R(S(T(v))).$$

Let  $A \in M_{m \times n}(\mathbb{F})$  and  $B \in M_{l \times m}(\mathbb{F})$ . Then,  $L_A : \mathbb{F}^n \to \mathbb{F}^m$  and  $L_B : \mathbb{F}^m \to \mathbb{F}^l$ , and have composition  $L_B \circ L_A : \mathbb{F}^n \to \mathbb{F}^l$ . We know that  $L_B \circ L_A$  is a linear transformation, and thus must be equal to  $L_C$  for some matrix  $C \in M_{l \times n}(\mathbb{F})$ . Indeed, C is the matrix representation of the transformation  $[L_B \circ L_A]$ , as proven previously.

Let  $\beta = \{e_1, \dots, e_n\}$  for  $\mathbb{F}^n$ , then

$$[L_B \circ L_A] = \begin{pmatrix} & & & & | \\ L_B \circ L_A(e_1) & \cdots & L_B \circ L_A(e_n) \\ & & & | \end{pmatrix} = \begin{pmatrix} & & & | \\ B \cdot (A \cdot e_1) & \cdots & B \cdot (A \cdot e_n) \\ & & & | \end{pmatrix}$$

### **○ Definition** 2.9: Matrix Multiplication

For matrices  $A \in M_{m \times n}(\mathbb{F})$  and  $B \in M_{l \times m}(\mathbb{F})$ , define their product  $B \cdot A$  to be the matrix

$$[L_B \circ L_A] = \begin{pmatrix} | & | & | \\ B \cdot (A \cdot e_1) & \cdots & B \cdot (A \cdot e_n) \end{pmatrix} = \begin{pmatrix} | & | & | \\ B \cdot A^{(1)} & \cdots & B \cdot A^{(2)} \\ | & | & | \end{pmatrix} = \begin{pmatrix} c_{ij} \end{pmatrix}_{\substack{1 \le j \le n \\ 1 \le i \le l}}^{1 \le j \le n}$$

where  $A^{(j)}$  is the jth column of A,  $c_{ij} := \begin{pmatrix} - & B_{(i)} & - \end{pmatrix} \cdot \begin{pmatrix} | & A^{(j)} \\ | & | \end{pmatrix}$ .

## **→ Proposition 2.11**

 $[L_B \circ L_A] = B \cdot A$ , ie  $L_B \circ L_A = L_{B \cdot A}$ .

*Proof.* Follows from our definition.

# **←** Corollary 2.5

Matrix multiplication is association;  $C \cdot (B \cdot A) = (C \cdot B) \cdot A$  for  $A \in M_{m \times n}(\mathbb{F})$ ,  $B \in M_{l \times m}(\mathbb{F})$ ,  $C \in M_{k \times l}(\mathbb{F})$ .

*Proof.* 
$$C \cdot (B \cdot A) = [L_C \circ (L_B \circ L_A)] = [(L_C \circ L_B) \circ L_A] = (C \cdot B) \cdot A.$$

**Remark 2.12.** This is proven by the linear transformation representation of matrices; try proving this directly from our definition.

### **←** Corollary 2.6

Let V, W, U be finite-dimensional vector spaces over  $\mathbb{F}$ ,  $T:V\to W$ ,  $S:W\to U$  be linear transformations and  $\alpha$ ,  $\beta$ ,  $\gamma$  be bases for V, W, U resp. Then,

$$[S \circ T]_{\alpha}^{\gamma} = [S]_{\beta}^{\gamma} \cdot [T]_{\alpha}^{\beta}.$$

*Proof.* Follows from the commutativity of the diagrams:

In "words", for  $v \in V$ ,

$$[S \circ T]^{\gamma}_{\alpha} \cdot [v]_{\alpha} = [(S \circ T)(v)]^{\gamma}_{\alpha} = [S(T(v))]_{\alpha} = [S]^{\gamma}_{\beta} \cdot [T(v)]_{\beta} = [S]^{\gamma}_{\beta} \cdot [T]^{\beta}_{\alpha} \cdot [v]_{\alpha},$$

ie we have shown that  $L_{[S \circ T]^{\gamma}_{\alpha}} = L_{[S]^{\gamma}_{\beta} \cdot [T]^{\beta}_{\alpha}}$ . Because  $A \mapsto L_A$  is an isomorphism, it follows that  $[S \circ T]^{\gamma}_{\alpha} = [S]^{\gamma}_{\beta} \cdot [T]^{\beta}_{\alpha}$ .

← Lecture 13; Last Updated: Mon Mar 25 13:48:03 EDT 2024

# 2.7 Inverses of Transformations and Matrices

**Remark 2.13.** Recall that, given a function  $f: X \to Y$ , a function  $g: Y \to X$  is called

- 1. *a* left inverse of f if  $g \circ f = Id_X$ ;
- 2. *a* right inverse of f if  $f \circ g = Id_X$ ;
- 3. a (two-sided) inverse of f if g both a left and right inverse of f.

If an inverse exists, it is unique; let  $g_0$ ,  $g_1$  be inverse of f, then,  $g_0 = g_0 \circ (f \circ g_1) = (g_0 \circ f) \circ g_1 = g_1$ .

# **→ Proposition 2.12**

Let  $f: X \to Y$ . Then,

- 1. f has a left-inverse  $\iff$  f injective;
- 2. f has a right-inverse  $\iff$  f surjective;
- 3. f has an inverse  $\iff$  f bijective.

<u>Proof.</u> ((a),  $\Longrightarrow$ ) Suppose  $g: Y \to X$  is a left-inverse of f and  $f(x_1) = f(x_2)$ . Then,  $g \circ f(x_1) = g \circ f(x_2) \Longrightarrow x_1 = x_2$  and so f injective.

((b),  $\Longrightarrow$ ) Suppose  $g: Y \to X$  is a right-inverse of f and let  $y \in Y$ . Then,  $f(g(y)) = y \Longrightarrow y \in f(X)$ .

The remainder of the cases and directions are left as an exercise.

**Remark 2.14.** *Proof of* (b),  $\iff$  *uses Axiom of Choice.* 

#### **⊗ Example 2.2**

- 1. The differentiation transform  $\delta : \mathbb{F}[t]_{n+1} \to \mathbb{F}[t]_n$ ,  $p(t) \mapsto p'(t)$  has a right inverse, the integration transform,  $\iota : \mathbb{F}[t]_n \to \mathbb{F}[t]_{n+1}$ ,  $p(t) \mapsto$  antiderivative of p(t); conversely,  $\iota$  has left inverse  $\delta$ ; they do not admit inverses.
- 2. Let  $f : \mathbb{F}[\![t]\!] \to \mathbb{F}[\![t]\!]$  be the left-shift map, where  $\sum_{n=0}^{\infty} a_n t^n \mapsto \sum_{n=1}^{\infty} a_n t^{n-1}$ . Then,  $g : \mathbb{F}[\![t]\!] \to \mathbb{F}[\![t]\!]$  with  $\sum_{n=0}^{\infty} a_n t^n \mapsto \sum_{n=0}^{\infty} a_n t^{n+1}$ , the right-shift map, is a right inverse of f, but f has no left inverse (it is not injective).

**Remark 2.15.** The existence of only one-sided inverses existing happens only when in infinite-dimensional vectors spaces, or when the dimension of the domain is not the same as the dimension of the codomain.

### ← Corollary 2.7: Of Rank-Nullity Theorem

Let  $T: V \to W$  s.t.  $\dim(V) = \dim(W) < \infty$ . TFAE:

- 1. *T* has a left-inverse;
- 2. *T* has a right-inverse;
- 3. *T* is invertible (has an inverse).

*Proof.* We have already that T injective  $\iff T$  surjective  $\iff T$  bijective.

### **→ Definition 2.10: Matrix Inverse**

We call a  $n \times n$  matrix B over  $\mathbb{F}$  the *inverse* of an  $n \times n$  matrix A over  $\mathbb{F}$  if  $A \cdot B = B \cdot A = I_n$ . We denote  $B = A^{-1}$ .

## **←** Proposition 2.13

Let  $A \in M_n(\mathbb{F})$ . Then,

- 1.  $L_A$  is invertible  $\iff$  A is invertible, in which case  $L_A^{-1} = L_{A^{-1}}$ ;
- 2. A is invertible  $\iff$  it has a left-inverse, ie  $B \cdot A = I_n \iff$  it has a right-inverse, ie  $A \cdot B = I_n$ .

- 1.  $L_A$  invertible  $\iff \exists T : \mathbb{F}^n \to \mathbb{F}^n$ -linear s.t.  $L_A \circ T = T \circ L_A = I_{\mathbb{F}^n} \iff \exists \text{ a matrix } B \in M_n(\mathbb{F})$ Proof. such that  $L_A \circ L_B = L_B \circ L_A = I_{\mathbb{F}^n} \iff$  there is a matrix  $B \in M_n(\mathbb{F})$  s.t.  $L_{AB} = L_{BA} = I_{\mathbb{F}^n} \iff$  there is a  $B \in M_n(\mathbb{F})$  s.t.  $A \cdot B = B \cdot A = I_n$ .
  - 2. Follows directly from corollary 2.7 and part 1.

#### **Invariant Subspaces and Nilpotent Transformations** 2.8

#### → Definition 2.11: *T*-Invariant

Let  $T: V \to V$  be a linear transformation. We call a subspace  $W \subseteq V$  *T-invariant* if  $T(W) \subseteq W$ .

### **® Example 2.3: Examples of Invariant Subspaces**

- 1. For any  $T: V \to V$ ,  $\operatorname{Im}(T)$  is T-invariant.
- 2. For any  $T: V \to V$ , Ker(T) is T-invariant, since  $T(v) = 0_V \in Ker(T) \, \forall \, v \in Ker(T)$ . Moreover, for any  $n \in \mathbb{N}$ , the space  $Ker(T^n)$  is T-invariant. <sup>10</sup>

← Lecture 14; Last Updated: Mon Mar 25 13:48:03 EDT 2024

### $\hookrightarrow$ Proposition 2.14

§2.8

For a linear operator  $T: V \to V$ , the following hold:

- 1.  $V \supseteq \operatorname{Im}(T) \supseteq \operatorname{Im}(T^2) \supseteq \cdots \supseteq \operatorname{Im}(T^n) \supseteq \cdots$ . Moreover,  $\operatorname{Im}(T^n)$  is T-invariant for any  $n \in \mathbb{N}$ .
- 2.  $\{0_V\} \subseteq \text{Ker}(T) \subseteq \text{Ker}(T^2) \subseteq \cdots \subseteq \text{Ker}(T^n) \subseteq \cdots$ . Moreover,  $\text{Ker}(T^n)$  is T-invariant for any  $n \in \mathbb{N}$ .
- 1. If  $x \in \text{Im}(T^{n+1})$ , then  $x = T^{n+1}(y) = T^n(T(y)) \in \text{Im}(T^n)$  for some  $y \in V$ , hence  $\text{Im}(T^{n+1}) \subseteq \text{Im}(T^n)$ . *Proof.* If  $x \in \text{Im}(T^n)$ , then  $x = T^n(y)$  so  $T(x) = T(T^n(y)) = T^n(T(y)) \in \text{Im}(T^n)$ , so  $T(\text{Im}(T^n)) \subseteq \text{Im}(T^n)$ .
  - 2. If  $x \in \text{Ker}(T^n)$ , then  $T^{n+1}(x) = T(T^n(x)) = T(0_V) = 0_V$  hence  $x \in \text{Ker}(T^{n+1})$  so  $\text{Ker}(T^n) \subseteq \text{Ker}(T^{n+1})$ . Moreover,  $T(x) \in \text{Ker}(T^n)$  since  $T(x) \in \text{Ker}(T^{n-1}) \subseteq \text{Ker}(T^n)$ , since  $T^{n-1}(T(x)) = T^n(x) = 0_V$  so  $T(Ker(T^n)) \subseteq Ker(T^n)$ .

### **® Example 2.4: More Examples of Invariant Subspaces**

Let  $T : \mathbb{R}^3 \to \mathbb{R}^3$  by T(x, y, z) := (2x + y, 3x - y, 7z). Then, the x - y plane,  $\{(x, y, z) \in \mathbb{R}^3 : z = 0\}$ is *T*-invariant, as is the *z* axis,  $\{(x,y,z) \in \mathbb{R}^3 : x = y = 0\}$ . Hence, we can decompose  $\mathbb{R}^3$  into two

<sup>&</sup>lt;sup>9</sup>Because the domain and codomain are the same, we often call *T* a "linear operator".  ${}^{10}T^n := T \circ T \circ \cdots \circ T$ , n times;  $T^0 := I_V$ .

#### *T*-invariant subspaces, namely x - y plane $\oplus z$ -axis.

### **○ Definition 2.12: Nilpotent**

In a ring R, an element  $r \in R$  is called *nilpotent* if  $r^n = 0$  for some  $n \in \mathbb{N}^+$ .

A linear transformation  $T: V \to V$  is called nilpotent if  $T^n = 0$  for some  $n \in \mathbb{N}^{+,11}$ 

For a matrix  $A \in M_n(\mathbb{F})$ , A is called nilpotent if  $A^n = 0_n$  for some  $n \in \mathbb{N}^+$ .

### **® Example 2.5: Examples of Nilpotent Transformations**

- 1. Let V, n-dimensional vector space over  $\mathbb{F}$  with basis  $\beta := \{v_1, \dots, v_n\}$ . Let  $T: V \to V$  be the unique linear transformation that "shifts"  $\beta$ : ie,  $T(v_1) := 0_V$ ,  $T(v_2) := v_1, \dots, T(v_n) = v_{n-1}$ .
- 2. The differentiation operation,  $\delta : \mathbb{F}[t]_n \to \mathbb{F}[t]_n$  is nilpotent, since  $\delta^{n+1} = 0$  for any polynomial.
- 3. For any matrix  $A \in M_n(\mathbb{F})$ , A is nilpotent iff  $L_A : \mathbb{F}^n \to \mathbb{F}^n$  is nilpotent.

Proof. 
$$L_{A^k} = L_A^k \implies A^k = 0 \iff L_{A^k} = 0 \iff L_A^k = 0$$

4.  $n \times n$  matrices that are strictly upper triangular<sup>12</sup> are nilpotent. For instance, for  $3 \times 3$ , we need to show<sup>13</sup>

$$\begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix}^{3} = 0 \iff \begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix}^{3} \cdot \begin{pmatrix} \star \\ \star \\ \star \end{pmatrix} = 0$$

<sup>&</sup>lt;sup>11</sup>One can verify that all linear transformations  $T:V\to V$  from a vector space to itself form a ring with  $(\circ,+)$ , ie composition and ("standard") addition of transformations. The same holds for linear operators defined over an abelian group (where the same + operation is endowed by the ring).

We have:

$$\begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix}^{2} \begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \star \\ \star \\ \star \\ \star \end{pmatrix} = \begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix}^{2} \begin{pmatrix} \star \\ \star \\ \star \\ 0 \end{pmatrix}$$

$$= \begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 0 & * & * \\ \star \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \star \\ \star \\ \star \\ 0 \end{pmatrix}$$

$$= \begin{pmatrix} 0 & * & * \\ 0 & 0 & * \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \star \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

$$= \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}.$$

### **→ Proposition 2.15**

If *V* is *n*-dimensional and  $T: V \to V$  is a linear nilpotent transformation, then  $T^n = 0$ .

*Proof.* Left as a (homework) exercise.

#### → Definition 2.13: Domain Restriction

For a function  $f: X \to Y$  and  $A \subseteq X$ , we define the *restriction* of f to A as the function  $f|_A: A \to Y$  given by  $a \mapsto f(a)$ .

### **→ Definition 2.14: Direct Sum**

Let *V* be a vector space over  $\mathbb{F}$ , and let  $W_0, W_1 \subseteq V$  be subspaces of *V*. If

- 1.  $W_0 \cap W_1 = \{0_V\}$  (the subspaces are *linearly independent*), and
- 2.  $W_0 + W_1 = \{w_0 + w_1 : w_0 \in W_0, w_1 \in W_1\} = V$

we write  $V = W_0 \oplus W_1$ , and say V is the *direct sum* if  $W_0, W_1$ .

<sup>&</sup>lt;sup>13</sup>ie zeros everywhere except cells strictly above diagonal.

<sup>&</sup>lt;sup>13</sup>Where we denote arbitrary elements ★; different ★s are not necessarily equal.

#### → Theorem 2.8: Fitting's Lemma

For finite dimensional vector space V over  $\mathbb{F}$  and a linear transformation  $T:V\to V$ , there is a decomposition

$$V = U \oplus W$$

as a direct sum of *T*-invariant subspaces *U*, *W* such that  $T|_U : U \to U$  is nilpotent and  $T|_W : W \to W$  is an isomorphism.

<u>Proof.</u> Recall that  $\text{Im}(T) \supseteq \cdots \supseteq \text{Im}(T^n)$  and  $\text{Ker}(T) \subseteq \cdots \subseteq \text{Ker}(T^n)$ . Both of these become constant eventually, ie the inequalities become strict equalities, hence  $\exists N \in \mathbb{N}^+$  such that  $\forall k \in \mathbb{N}$ ,  $\text{Im}(T^{N+k}) = \text{Im}(T^N)$  and  $\text{Ker}(T^{N+k}) = \text{Ker}(T^N)$ .

Let  $U := \text{Ker}(T^N)$  and  $W := \text{Im}(T^N)$ . These are clearly T-invariant.

 $T^N(\text{Ker}(T^N)) = \{0_V\}$ , and  $T(\text{Im}(T^N)) = \text{Im}(T^{N+1}) = \text{Im}(T^N) = W$  and thus  $T|_W : W \to W$  is surjective and hence  $T|_W$  must be injective and thus an isomorphism.

It remains to show that  $V = U \oplus W$ . If  $v \in U \cap W$ ,  $T^N(v) = 0_V$  but  $T|_W$  an isomorphism so  $T^N(v) = 0 \iff v = 0_V$ , hence  $U \cap W = \{0_V\}$ .

Thus, we have  $\dim(U+W) = \dim(U) + \dim(W) - \dim(U\cap W) = \dim(U) + \dim(W) = \dim(V)$ ; moreover, it must be that U+W=V.<sup>14</sup>

 $\hookrightarrow Lecture~15; Last~Updated:~Mon~Mar~25~13:48:03~EDT~2024$ 

## 2.9 Dual Spaces

## **→ Definition 2.15: Dual Space**

For a vector space V over a field  $\mathbb{F}$ , linear transformations from  $V \to \mathbb{F}$  (where we view  $\mathbb{F}$  as a one-dimensional vector space over  $\mathbb{F}$ ) are called *linear functionals*. The space of linear functionals (namely,  $\operatorname{Hom}(V,\mathbb{F})$ ) is denoted  $V^*$ , and called the *dual space* of V.

## **←** Proposition 2.16

If *V* is finite dimensional,  $\dim(V^*) = \dim(V)$ .<sup>15</sup>

*Proof.* For finite dimensional V, we know that  $\dim(\operatorname{Hom}(V,\mathbb{F})) = \dim(V) \cdot \dim(\mathbb{F}) = \dim(V)$ , hence  $\dim(V^*) = \overline{\dim(V)}$ . In the same notation with which we proved this originally in proposition 2.6; fix a basis  $\beta := \{v_1, \ldots, v_n\}$  for V and the standard basis  $\gamma := \{1\}$  for  $\mathbb{F}$ , and defined  $\beta^* := \{f_1, \ldots, f_n\}$ , where  $f_i := T_{v_i,1} : V \to \mathbb{F}$  maps  $v_i \mapsto 1$  and every other basis vector to  $0_{\mathbb{F}}$ .

**Remark 2.16.** *The basis*  $\beta^*$  *for*  $V^*$  *is called the* dual basis. *Explicitly, we have:* 

<sup>&</sup>lt;sup>14</sup>It is precisely here that we use finiteness of V.

<sup>&</sup>lt;sup>15</sup>This does *not* hold for infinite dimensional spaces.

#### **Corollary 2.8**

Let *V* be a finite dimensional vector space over  $\mathbb{F}$  and let  $\beta := \{v_1, \dots, v_n\}$  be a basis for *V*. Then,

$$\beta^* := \{f_1, \ldots, f_n\}$$

is a basis for  $V^*$ . Moreover, for each linear functional  $f \in V^*$ ,

$$f = \sum_{i=1}^{n} f(v_i) \cdot f_i.$$

*Proof.* Linear independence: let  $a_1f_1 + \cdots + a_nf_n = 0_{V^*} =: 0$ . Then,

$$(a_1f_1 + \cdots + a_nf_n)(v_i) = a_if_i(v_i) = a_i \cdot 1 = a_i \implies a_i = 0,$$

hence  $\beta^*$  indeed linearly independent.

Spanning: let  $f \in V^*$ . We claim that  $f = \sum_{i=1}^n f(v_i)f_i$ . It suffices to show these two sides are equal on the basis vectors, as linear transformations are determined by their effect on basis vectors. We have:

$$\left(\sum_{i=1}^{n} f(v_i) f_i\right)(v_j) = \sum_{i=1}^{n} f(v_i) f_i(v_j) = \sum_{i=1}^{n} f(v_i) \cdot \delta_{ij} = f(v_j),$$

as desired. 16

### **⊗ Example 2.6**

- 1. Let  $V := \mathbb{F}^n$  and  $\beta := \{v_1, \dots, v_n\}$  be a basis for  $\mathbb{F}^n$ , viewed as column vectors, and let  $\beta^* := \{f_1, \dots, f_n\}$  be the dual basis for  $V^*$ . Recall that  $f_i : \mathbb{F}^n \to \mathbb{F}$ , hence  $f_i := L_{A_i}$  for some matrix  $A_i \in M_{1 \times n}(\mathbb{F}) := \text{space of } 1 \times n \text{ row vectors. Hence, } A_i = e_i^t$ .
- 2. Consider  $V^{**}$ , the dual of the dual. If V is finite-dimensional, then as  $\dim(V) = \dim(V^*)$ , we have  $\dim(V) = \dim(V^*) = \dim(V^{**})$ , ie, they are (abstractly) isomorphic.

We have that  $T: V \to V^*$ ,  $v_i \mapsto f_i$  is an isomorphism; we define an explicit isomorphism to  $V^{**}$  below.

### **→ Definition 2.16**

Let *V* be an arbitrary vector space over  $\mathbb{F}$ . For each  $x \in V$ , define  $\hat{x} \in V^{**}$  by  $\hat{x} : V^* \to \mathbb{F}$ , where  $\hat{x}(f) := f(x)$ .

**Remark 2.17.** *Note that*  $\hat{x}$  *is linear.* 

<sup>16</sup>Where 
$$\delta_{ij} := \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases}$$
 is the Kronecker delta.

#### **→ Theorem 2.9**

The map  $x \mapsto \hat{x} : V \to V^{**}$  is a linear injection. In particular, if V is finite dimensional, it is an isomorphism.

*Proof.* Let  $x \in V$  and suppose  $\hat{x} = 0_{V^*}$ . Let  $\beta$  be a basis for V and  $\beta^*$  its dual basis. Let  $x = a_1v_1 + \cdots + a_nv_n$  for  $v_i \in \beta$ ,  $a_i \in \mathbb{F}$ . Let  $f_i$  such that  $f_i(v_j) = \delta_{ij}v_j$ . Then,

$$\hat{x} f_i = f_i(x) = f_i(a_1 v_1 + \cdots + a_n v_n) = a_i = 0,$$

hence,  $a_i = 0 \,\forall i$ . Hence, x = 0, and thus  $\hat{x}$  has a trivial kernel and is thus injective.

← Lecture 16; Last Updated: Mon Mar 25 13:48:03 EDT 2024

**Remark 2.18.** Notice that to get an isomorphism  $V \cong V^*$ , we fixed a basis for V to define it. However, for  $V \cong V^{**}$ , we had a canonical isomorphism independent of choice of basis. Writing  $S \subseteq V$ ,  $\hat{S} := \{\hat{x} : x \in S\} \subseteq V^{**}$ , our theorem says that  $\hat{V} = V^{**}$  for finite-dimensional V.

#### **○ Definition 2.17: Annihilator**

Let *V* be a vector space over  $\mathbb{F}$  and  $S \subseteq V$ . We call

$$S^{\perp} := \{ f \in V^* : f|_S = 0 \} = \{ f \in V^* : f(u) = 0 \, \forall \, u \in S \}$$

the *annihilator* of *S*.

### **→ Proposition 2.17**

Let *V* be a vector space over  $\mathbb{F}$  and  $S \subseteq V$ .

- 1.  $S^{\perp}$  is a subspace of  $V^{*17}$
- $2. S_1 \subseteq S_2 \subseteq V \implies S_1^{\perp} \supseteq S_2^{\perp}$
- 3.  $S^{\perp} = (\operatorname{Span}(S))^{\perp}$

*Proof.* 1. If  $f_1, f_2 \in S^{\perp}, a \in \mathbb{F}$ , then  $\forall u \in S$ ,

$$(af_1 + f_2)(u) = af_1(u) + f_2(u) = a \cdot 0 + 0,$$

so 
$$a f_1 + f_2 \in S^{\perp}$$
.

- 2. Clear.
- 3. If  $f \in V^*$  takes all vectors in S to 0, then it does the same for linear combinations.

<sup>&</sup>lt;sup>17</sup>Even if *S* is not a subspace itself.

### **→ Proposition 2.18**

If *V* is finite dimensional and  $U \subseteq V$  a subspace, then  $(U^{\perp})^{\perp} = \hat{U}$ .

*Proof.* We know that  $V^{**} = \hat{V}$ , so we fix  $\hat{x} \in \hat{V}$  and show that

$$\hat{x} \in (U^{\perp})^{\perp} \iff \hat{x} \in \hat{U} \iff x \in U.$$

We have

$$\hat{x} \in (U^{\perp})^{\perp} : \iff \forall f \in U^{\perp}, \hat{x}(f) = f(x) = 0$$

hence if  $x \in U$ , then  $\hat{x} \in (U^{\perp})^{\perp}$ , so  $\hat{U} \subseteq (U^{\perp})^{\perp}$ .

Conversely, let  $\hat{x} \in (U^{\perp})^{\perp}$ . Then,  $\forall f \in U^{\perp}$ , f(x) = 0.

Suppose towards a contradiction that  $x \notin U$ . We aim to define  $f \in U^{\perp}$  s.t. f(x) = 1, obtaining a contradiction. Let  $\{u_1, \ldots, u_k\}$  be a basis for U, noting that  $\{u_1, \ldots, u_k, x\}$  still linearly independent by assumption of  $x \notin U = \operatorname{Span}(\{u_1, \ldots, u_k\})$ . Thus, we can extend this to a basis  $\beta = \{u_1, \ldots, u_k, x, v_1, \ldots, v_m\}$  for V. Define  $f: V \to \mathbb{F} \in V^*$  as the unique linear transformation such that  $f(u_i) = f(v_j) = 0$  and f(x) = 1. Then,  $f \in U^{\perp}$  by definition, and f(x) = 1 by definition. This is a contradiction that  $x \notin U$ .

### 

For a finite dimensional V and subspace  $U \subseteq V$ ,

$$U=\{x\in V:\,\forall\,f\in U^\perp,f(x)=0\}.$$

## $\hookrightarrow$ **Definition 2.18: Dual/Transpose of** T

Let V, W be vector spaces over a field  $\mathbb{F}$  and  $T: V \to W$ . We define the *dual/transpose* of T as the map  $T^t: W^* \to V^*$ , given by  $g \mapsto g \circ T$ . Ie,  $T^t(g)(v) \coloneqq g \circ T(v) = g(T(v))$ .

## $\hookrightarrow$ Proposition 2.19

Let V, W be vector spaces over a field  $\mathbb{F}$  and  $T: V \to W$ .

- 1.  $T^t$  is linear.
- 2.  $Ker(T^t) = (Im(T))^{\perp}$ .
- 3.  $Im(T^t) \subseteq (Ker(T))^{\perp}$  and is equal if V, W are finite dimensional.
- 4. If V, W are finite dimensional and  $\beta$ ,  $\gamma$  are bases resp., then

$$[T^t]_{\gamma^*}^{\beta^*} = ([T]_{\beta}^{\gamma})^t.$$

Proof. 1.  $T^t(ag_1 + g_2) = (ag_1 + g_2) \circ T = a \cdot g_1 \circ T + g_2 \circ T = a \cdot T^t(g_1) + T^*(g_2), \forall g_1, g_2 \in W^*, a \in \mathbb{F}$ .

2. For  $g \in W^*$ ,

$$g \in \operatorname{Ker}(T^{t}) : \iff T^{t}(g) = 0_{V^{*}} \iff T^{t}(g)(v) = 0 \,\forall \, v \in V$$

$$\iff g(T(v)) = 0 \,\forall \, v \in V$$

$$\iff g(w) = 0 \,\forall \, w \in \operatorname{Im}(T)$$

$$\iff g \in (\operatorname{Im}(T))^{\perp}$$

3. Fix  $f = T^t(g) \in \text{Im}(T^t)$ ,  $g \in W^*$ , and  $u \in \text{Ker}(T)$ , noting that  $f(u) = T^t(g)(u) = g(T(u)) = g(0_W) = 0$  so  $f \in (\text{Ker}(T))^{\perp}$ .

Suppose now V, W are finite dimensional; we've shown an inclusion, so it suffices now to show that  $\dim(\operatorname{Im}(T^t)) = \dim(\operatorname{Ker}(T))^{\perp}$ . We have:

$$dim(Im(T^{t})) = dim(W^{*}) - dim(Ker(T^{t}))$$

$$= dim(W) - dim(Im(T)^{\perp})$$

$$= dim(W) - dim(W) + dim(Im(T))$$

$$= dim(Im(T))$$

OTOH:

$$\dim(\operatorname{Ker}(T)^{\perp}) = \dim(V) - \dim(\operatorname{Ker}(T)) = \dim(\operatorname{Im}(T)),$$

and thus  $\dim(\operatorname{Im}(T^t)) = \dim(\operatorname{Ker}(T))^{\perp}$  (remarking that the first equality follows from 1. of the following theorem, and 2. from the dimension theorem).

4. Let  $\beta := \{v_1, \dots, v_n\}, \gamma := \{w_1, \dots, w_m\}$  be finite bases for V, W resp. Recall that

$$A := [T]_{\beta}^{\gamma} := \begin{pmatrix} | & & | \\ [T(v_1)]_{\gamma} & \cdots & [T(v_n)]_{\gamma} \\ | & & | \end{pmatrix},$$

ie  $A^{(j)} = [T(v_j)]_{\gamma}$  hence  $T(v_j) = \sum_{k=1}^{m} A_{kj} w_k$ .

Similarly, write  $\gamma^* := \{g_1, \dots, g_m\}$  and  $\beta^* := \{f_1, \dots, f_n\}$ , then

$$B := [T^t]_{\gamma^*}^{\beta^*} := \begin{pmatrix} | & | & | \\ [T^t(g_1)]_{\beta^*} & \cdots & [T^t(g_m)]_{\beta^*} \end{pmatrix},$$

so  $T^t(g_i) = \sum_{\ell=1}^n B_{\ell i} f_\ell = \sum_{\ell=1}^n T^t(g_i)(v_\ell) f_\ell$ , so  $B_{\ell i} = T^t(g_i)(v_\ell)$ . To complete the proof, we must show that

 $A_{ij} = B_{ji}$  for all i, j:

$$B_{ji} = T^{t}(g_{i})(v_{j}) = g_{i}(T(v_{j})) = g_{i}(\sum_{k=1}^{m} A_{kj}w_{k}) = \sum_{k=1}^{m} A_{kj}g_{i}(w_{k}) = A_{ij},$$

where the last equality  $g_i(w_k) = \delta_{ik}$ , by construction.

← Lecture 17; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### → Theorem 2.10

Let *V* be a finite-dimensional vector space over  $\mathbb{F}$  and  $U \subseteq V$  be a subspace.

- 1.  $\dim(U^{\perp}) = \dim(V) \dim(U)$ . In fact, if  $\{v_1, \dots, v_k\}$  is a basis for U and  $\beta := \{v_1, \dots, v_k, v_{k+1}, \dots, v_n\}$  is a basis for V with the dual basis  $\beta^* = \{f_1, \dots, f_n\}$ , then  $\{f_{k+1}, \dots, f_n\}$  is a basis for  $U^{\perp}$ .
- 2.  $(V/U)^* \cong U^{\perp}$  by the map  $f \mapsto f_U$ , where  $f_U : V \to \mathbb{F}$  given by  $f_U(v) := f(v + U)$ .

*Proof.* Left as a (homework) exercise.

### **Corollary 2.10:** of proposition 2.19

Let V, W be vector spaces over  $\mathbb{F}$  and  $T:V\to W$  be a linear transformation.

- 1.  $T^t$  injective  $\iff T$  surjective.
- 2. If V, W finite dimensional, then  $T^t$  surjective  $\iff T$  injective.

2.  $\operatorname{Im}(T^t) = \operatorname{Ker}(T)^{\perp} \implies \operatorname{Im}(T^{\perp}) = V^* \iff \operatorname{Ker}(T) = \{0_V\}$ , following similar logic to above.

Remark 2.19. Part 4. of proposition 2.19 establishes a dependency between the columns and rows of a matrix; precisely:

← Lecture 18; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### 2.9.1 Application to Matrix Rank

#### → Definition 2.19: Matrix Rank/C-Rank, R-Rank

For a matrix  $A \in M_{m \times n}(\mathbb{F})$ , we define

$$rank(A) := rank(L_A)$$

and the column rank of

c-rank(A) := size of maximal indep. subset of columns { $A^{(1)}, \ldots, A^{(n)}$ }

and row rank of

r-rank(A) := size of maximal indep. subset of rows { $A_{(1)}, \ldots, A_{(m)}$  }.

**Remark 2.20.** *Notice that* rank(A) = c-rank(A).

$$\hookrightarrow$$
 Corollary 2.11

$$rank(A) = rank(A^t) = r-rank(A)$$

<u>Proof.</u> We know already that  $rank(A^t) = c\text{-rank}(A^t) = r\text{-rank}(A)$ , as remarked previously, hence we need only to show that  $rank(A^t) = rank(A)$ . But  $A = [L_A]$  and  $A^t = [L_{A^t}] = [L_A]^t = [L_A^t]$ . Thus,  $rank(A) = rank(L_A) = rank(L_A^t) = rank(A^t)$ .

$$rank(A) = c-rank(A) = r-rank(A), \quad \forall A \in M_{m \times n}(\mathbb{F})$$

## 3 Elementary Matrices, Matrix Operations

## 3.1 Systems of Linear Equations

We can write a system of m equations of n unknowns  $x_i$ 

$$\begin{cases} a_{11}x_1 + \dots + a_{1n}x_n = b_1 \\ \vdots & \ddots & \vdots \\ a_{m1}x_1 + \dots + a_{mn}x_n = b_m \end{cases}$$

succinctly as a matrix equation

$$A \cdot \vec{x} = \vec{b}$$
.

where 
$$A := (a_{ij}) \in M_{m \times n}(\mathbb{F})$$
,  $\vec{x} = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix}$ , and  $\vec{b} := \begin{pmatrix} b_1 \\ \vdots \\ b_m \end{pmatrix} \in \mathbb{F}^m$ . Hence,  $\vec{x}$  solves  $A\vec{x} = \vec{b} \iff L_A(\vec{x}) = \vec{b} \iff$ 

 $\vec{x} \in L_A^{-1}(\vec{b})$ . In other words, a solution exists iff  $\vec{b} \in \text{Im}(L_A) = \text{Span}(A^{(1)}, \dots, A^{(n)})$ . In particular, when  $\vec{b} = \vec{0}$ , a solution always exists,  $\vec{x} = \vec{0}$ . We call  $A \cdot \vec{x} = \vec{0}$  the homogeneous system of equations of A.

It follows that  $A \cdot \vec{x} = \vec{0}$  has nonzero solutions  $\iff$  Ker( $L_A$ ) non-trivial. Moreover, if  $A \cdot \vec{x} = \vec{b}$  and  $A \cdot \vec{y} = \vec{0}$ , then  $A \cdot (\vec{x} + \vec{y}) = \vec{b}$  as well by linearity.

### **→** Proposition 3.1

For  $A \in M_{m \times n}(\mathbb{F})$  and  $b \in \text{Im}(L_A)$  the set of solutions to  $A\vec{x} = \vec{b}$  is precisely the coset  $\vec{v} + \text{Ker}(L_A)$  where  $\vec{v} \in \mathbb{F}^n$  is a particular solution to  $A\vec{x} = \vec{b}$ ;  $A\vec{v} = \vec{b}$ .

<u>Proof.</u>  $\vec{v}$ + an element of  $\text{Ker}(L_A)$  is a solution to  $A\vec{x} = \vec{b}$ . Conversely, if  $\vec{v}$ ,  $\vec{w}$  are solutions to  $A\vec{x} = \vec{b}$ , then  $A \cdot (\vec{v} - \vec{w}) = \vec{b} - \vec{b} = \vec{0}$  so  $\vec{v} - \vec{w} \in \text{Ker}(L_A)$ , thus  $\vec{w} = \vec{v} + (\vec{v} - \vec{w}) \in \vec{v} + \text{Ker}(L_A)$ .

### **⇔** Corollary 3.1

If m < n and  $A \in M_{m \times n}(\mathbb{F})$ , then there is always a nonzero solution to the homogeneous equation  $A\vec{x} = \vec{0}$ 

*Proof.* nullity  $(L_A) = n - \text{rank}(L_A) = n - \text{dim}(\text{Im}(L_A)) \ge n - m > 0$  hence  $\text{Ker}(L_A)$  nontrivial.

 $\hookrightarrow$  Lecture 19; Last Updated: Mon Mar 25 13:48:03 EDT 2024

## **⇔** Corollary 3.2

For  $A \in M_{m \times n}(\mathbb{F})$ ,

- 1. Ker( $L_A$ ) =  $\{0_{\mathbb{F}^n}\}$   $\iff$   $A\vec{x} = \vec{b}$  has at most one solution, for each  $\vec{b} \in \mathbb{F}^m$ .
- 2. If n = m, A is invertible  $\iff A\vec{x} = \vec{b}$  has exactly one solution for each  $\vec{b} \in \mathbb{F}^m$ .

*Proof.* 1. follows from proposition 3.1. 2. follows from 1.

We would like to determine whether  $A\vec{x} = \vec{b}$  has a solution (equivalently, if  $\vec{b} \in \text{Im}(L_A)$ ), and to solve it, determining a particular solution, and Ker  $L_A$ .

## 3.2 Elementary Row/Column Operations, Matrices

### → Definition 3.1: Elementary Row (Column) Operations

Let  $A \in M_{m \times n}(\mathbb{F})$ . An elementary row (column) operation is one of the following operations applied to A:

- 1. Interchanging any two rows (columns) of *A*;
- 2. Multiplying a row (column) by a nonzero scalar from  $\mathbb{F}$ ;
- 3. Adding a scalar multiple of one row (column) to another.

**Remark 3.1.** All of these operations are (clearly) invertible. Moreover, each of these operations can be seen as linear transformations  $M_{m \times n}(\mathbb{F}) \to M_{m \times n}(\mathbb{F})$ , and can thus be represented as  $(m \cdot n) \times (m \cdot n)$  matrices.

## **→ Definition 3.2: Elementary Matrix**

A matrix  $E \in M_n(\mathbb{F})$  is called *elementary* if it is obtained from  $I_n$  by an elementary row/column operation.

### **⊗ Example 3.1**

- 1.  $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$  is obtained from  $I_3$  by operation 1.; indeed, either swapping the last two rows or columns yields the same result.
- 2.  $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 3 \end{pmatrix}$  is obtained from  $I_3$  by operation 2.; again, either the row or column view yields the same.
- 3.  $\begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$  is obtained from  $I_3$  by operation 3.; again, either viewed as adding 2 times the second column to the first or 2 times the first row to the second.

## → <u>Theorem</u> 3.1: Elementary Matrices and Operations

Each elementary matrix can be obtained either by a row or column operation of the same kind.

*Proof.* Clear by example.

#### $\hookrightarrow$ Theorem 3.2

For matrices  $A, B \in M_{m \times n}(\mathbb{F})$ , if B is obtained from A by an elementary row (column) operation of type (i), then  $B = E \cdot A$  ( $B = A \cdot E$ ) for the elementary matrix  $E \in M_m(\mathbb{F})$  ( $M_n(\mathbb{F})$ ) obtained from the identity matrix by the same operation as in obtaining B from A.

Conversely, if *E* is an elementary matrix then  $E \cdot A$  ( $A \cdot E$ ) is obtained from *A* by applying the same elementary operations as in obtaining *E* from the identity matrix.

### **→ Proposition 3.2**

Elementary matrices are invertible, and the inverse is also an elementary matrix of the same type.

<u>Proof.</u> This follows from the fact that each elementary operation is invertible, and as each elementary operation can be representing as an elementary matrix, the result is clear.

← Lecture 20; Last Updated: Thu Feb 22 21:48:02 EST 2024

#### **→ Proposition 3.3**

- 1. If  $A \in M_{m \times n}(\mathbb{F})$ ,  $P \in GL_m(\mathbb{F})^{18}$ , and  $Q \in GL_n(\mathbb{F})$ , then  $rank(P \cdot A) = rank(A) = rank(A \cdot Q)$
- 2. More generally, if  $T:V\to W$  is a linear transformation, where V,W finite dimensional, and  $S:W\to W$  and  $R:V\to V$  are linear and invertible, then  $\mathrm{rank}(S\circ T)=\mathrm{rank}(T)=\mathrm{rank}(T\circ R)$ .

*Proof.* 1. follows directly from part 2., being a special case where  $T = L_A$ ,  $S = L_P$ ,  $R = L_Q$ .

We have that  $\operatorname{rank}(T) = \dim(\operatorname{Im}(T))$ , and as S an isomorphism,  $S|_{\operatorname{Im}(T)}$  is injective and thus  $S(\operatorname{Im}(T)) \cong \operatorname{Im}(T)$ , by S, so in particular,  $\operatorname{rank}(S \circ T) = \dim(S(\operatorname{Im}(T))) = \operatorname{rank}(\operatorname{Im}(T)) = \operatorname{rank}(T)$ .

For the other equality, we have that  $\text{Im}(T \circ R) = T(R(V)) = T(V) = \text{Im}(T)$  so  $\text{rank}(T) = \text{dim}(\text{Im}(T)) = \text{dim}(\text{Im}(T \circ R)) = \text{rank}(T \circ R)$ .

## **Corollary 3.3**

Elementary row/column operations (equivalently, multiplication by elementary matrices) are rankpreserving; if B obtained from A by a row/column operation, then rank(B) = rank(A).

*Proof.* Elementary operations correspond to multiplication by elementary matrices as we have shown previously, which are further invertible by proposition 3.2, which hence do not change the rank by proposition 3.3. ■

<sup>&</sup>lt;sup>18</sup>Denoting the space of invertible  $m \times m$  matrices.

### → Theorem 3.3: Diagonal Matrix Form

Every matrix  $A \in M_n(\mathbb{F})$  can be transformed into a matrix B of the form

$$\left(\left[\begin{array}{c}I_r\\0\end{array}\right]\left[\begin{array}{c}0\\0\end{array}\right]\right),$$

where the top right and bottom left [0]'s are  $n - r \times r$ , the bottom [0] is  $n - r \times n - r$ , using row, column operations. In particular, r = rank(A).

*Proof.* We prove by induction on n.

Base: If n = 0, A = () and we are done.

Inductive Step: Suppose  $n \ge 1$  and the statement holds for n-1. If A is all zeros, we are done. Else, A has some nonzero entry, and by swapping two rows and columns such that the entry is in the top left  $(a_11)$  of the matrix, and then multiplying by  $a_11^{-1}$  such that it is equal to 1,

$$\begin{pmatrix} 1 & \star & \cdots & \star \\ \star & \ddots & & \\ \vdots & & \ddots & \\ \star & & & \ddots \end{pmatrix}.$$

We can then use row (resp. column) operations such that each cell below (resp. to the right of) the top left 1 is equal to 0 by subtracting  $\star$  row (resp. column) one from each,

$$\begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & \ddots & & & \\ \vdots & & \ddots & & \\ 0 & & & \ddots \end{pmatrix}.$$

Applying induction the the  $n-1 \times n-1$  matrix we have left over in the bottom right block, we can transform this block into the desired form by row/column operations, not affecting A itself. This gives us the desired form of A.

## **←** Corollary 3.4

For each  $A \in M_n(\mathbb{F})$ , there are invertible matrices  $P, Q \in GL_n(\mathbb{F})$  such that

$$B:=P\cdot A\cdot Q$$

is of the form in theorem 3.3. Moreover, P and Q are products of elementary matrices.

*Proof.* Follows from row/column operations corresponding to left/right multiplication by elementary matrices.

#### **Corollary 3.5**

Every invertible matrix  $A \in GL_n(\mathbb{F})$  is a product of elementary matrices.

<u>Proof.</u> Let  $A \in GL_n(\mathbb{F})$ , so rank(A) = n. Then, by corollary 3.4, there exists matrices  $P, Q \in GL_n(\mathbb{F})$  such that  $\overline{PAQ} = I_n$  hence  $A = P^{-1}Q^{-1}$ . P, Q are themselves products of elementary matrices and thus their inverses are, hence A itself is a product of elementary matrices. ■

### **Corollary 3.6**

 $rank(A) = rank(A^t) \, \forall \, A \in M_n(\mathbb{F}).$ 

**Remark 3.2.** We've already proven this, but we present an alternative approach.

*Proof.* There are  $P, Q \in GL_n(\mathbb{F})$  such that B = PAQ of the desired diagonal form where  $r = \operatorname{rank}(A)$ . Then,  $\overline{B^t} = Q^t A^t P^t$ , and thus  $\operatorname{rank}(B^t) = \operatorname{rank}(A^t)$ . But  $B^t = B$  so  $\operatorname{rank}(B^t) = \operatorname{rank}(A)$  and thus  $\operatorname{rank}(A) = \operatorname{rank}(A^t)$  as desired. ■

### **Corollary 3.7 Corollary 3.7**

The transpose of an invertible matrix is invertible, with  $(A^t)^{-1} = (A^{-1})^t$ .

$$Proof. \ \ A \cdot A^{-1} = I_n = A^{-1} \cdot A \implies (A^{-1})^t \cdot A^t = I_n^t = I_n = A^t \cdot (A^{-1})^t.$$

 $\hookrightarrow Lecture~21; Last~Updated:~Mon~Mar~25~13:48:03~EDT~2024$ 

## 3.2.1 Application to Finding Inverse Matrix

If  $A \in M_n(\mathbb{F})$  is invertible, then  $A = E_1 \cdot \dots \cdot E_k$  for some elementary matrices  $E_i$ , so  $A^{-1} = E_k^{-1} \cdot \dots \cdot E_1^{-1} \cdot I_n$ .

Consider the augmented matrix  $(A|I_n)$ . Remark that  $B \cdot (A|I_n) = (BA|BI_n)$ , and in particular,  $E_k^{-1} \cdots E_1^{-1} \cdot (A|I_n) = (I_n|A^{-1})$ , ie, there are row operations that turn  $(A|I_n)$  to  $(I_n|A^{-1})$ .

### **←** Theorem 3.4

Let  $A \in M_n(\mathbb{F})$  be invertible.

- 1. There are row operations that turn  $(A|I_n)$  into  $(I_n|A^{-1})$ .
- 2. If row operations turn  $(A|I_n)$  into  $(I_n|B)$  then  $B=A^{-1}$ .

#### 3.2.2 Solving Systems of Linear Equations

#### **○→ Definition 3.3**

For matrices  $A_1, A_2 \in M_{m \times n}(\mathbb{F})$  and  $\vec{b}_1, \vec{b}_2 \in \mathbb{F}^m$ , the systems of linear equations  $A_1 \cdot \vec{x} = \vec{b}_1$  and  $A_2 \cdot \vec{x} = \vec{b}_2$  are called *equivalent* if their sets of solutions are equal.

In particular, any two systems with no solutions are equivalent.

### **→ Proposition 3.4**

If  $G \in GL_m(\mathbb{F})$  and  $A \in M_{m \times n}(\mathbb{F})$ ,  $\vec{b} \in \mathbb{F}^m$ , then  $G \cdot A\vec{x} = G \cdot \vec{b}$  is equivalent to  $A\vec{x} = \vec{b}$ 

*Proof.* Multiply both sides from the left by  $G^{-1}$ .

## 

Row operations applied to (A|b) do not change the solution set of  $A\vec{x} = \vec{b}$ .

#### **→ Definition 3.4:** ref/rref

Let  $B \in M_{m \times n}(\mathbb{F})$ . We say B is in row echelon form if

- 1. All zero rows are at the bottom, ie each nonzero row is above each zero row;
- 2. The first nonzero entry (called a pivot) of each row is the only nonzero entry in its column;
- 3. The pivot of each row appears to the right of the pivot of the previous row.

If all pivots are 1, then we say that *B* is in *reduced row echelon form*.

## → Theorem 3.5: Gaussian Elimination Theorem

There is a sequence of row operations of types 1. and 3. that bring any matrix  $A \in M_{m \times n}(\mathbb{F})$  to a row echelon form. Moreover, applying row operations of type 2. to a matrix in row echelon form results in a reduced row echelon form.

← Lecture 22; Last Updated: Sat Mar 9 09:25:26 EST 2024

## **⊗ Example 3.2**

so we have agumented matrix

$$(A|b) = \begin{pmatrix} 3 & 2 & 3 & -2 & | & 1 \\ 1 & 1 & 1 & 0 & | & 3 \\ 1 & 2 & 1 & -1 & | & 2 \end{pmatrix} \quad \xrightarrow{\text{Gaussian Elimination}} \quad \begin{pmatrix} 1 & 0 & 1 & 0 & | & 1 \\ 0 & 1 & 0 & 0 & | & 2 \\ 0 & 0 & 0 & 1 & | & 3 \end{pmatrix},$$

so r := rank(A) = 3 and  $\text{nullity}(L_A) = 4 - 3 = 1$ , so we expect a solution as a particular solution plus an ideal (the kernel). Rewriting, we see that

where  $t_1 \in \mathbb{F}$  arbitrary. Moreover, since setting  $t_1 = 0$  gives that  $\vec{v} := (1, 2, 0, 3)^t$  a solution, then  $t_1(-1, 0, 1, 0)^t$  is a solution to the homogeneous system  $A\vec{x} = \vec{0}$ , ie,  $\vec{u} := (-1, 0, 1, 0)^t$  is a basis for the kernel of  $Ker(L_A)$ .

### **←** Theorem 3.6

For any system  $A\vec{x} = \vec{b}$ , using Gaussian elimination we obtain another system  $A_1\vec{x} = \vec{b_1}$  where  $(A_1|\vec{b_1})$  is the reduced echelon form of  $(A|\vec{b})$ . Then:

- 1.  $A\vec{x} = \vec{b}$  has a solution  $\iff$  rank $(A_1|\vec{b_1}) = \text{rank}(A_1) = \sharp$  of non-zero rows of  $A_1$ .
- 2. If a solution exists, then, denoting  $r := \operatorname{rank}(A)$  and  $n := \sharp \operatorname{columns}$  of A, we have the general solution to  $A\vec{x} = \vec{b}$  of the form

$$\vec{v} + t_1 \vec{u}_1 + \dots + t_{n-r} \vec{u}_{n-r}$$

where  $\vec{v} \in \mathbb{F}^n$  and  $\{\vec{u}_1, \dots, \vec{u}_{n-r}\}$  a basis for  $\text{Ker}(L_A) = \text{space of solutions to } A\vec{x} = \vec{0}$ .

Proof. We will only prove 1.

Recall that  $A\vec{x} = \vec{b}$  has a solution  $\iff \vec{b} \in \text{Im}(L_A) = \text{Span}(\text{columns of } A) \iff \text{Span}(\text{columns of } A) = \text{Span}(\text{columns of } (A|b)) \iff \text{rank}(A) = \text{rank}((A|b)).$ 

### **⇔** Corollary 3.9

The system  $A\vec{x} = \vec{b}$  has a solution  $\iff$  in the reduced echelon form  $(A_1|\vec{b}_1)$  of the augmented matrix, we do not have a pivot in the last column.

#### **← Lemma 3.1**

Let  $B \in M_{m \times n}(\mathbb{F})$  be obtained from  $A \in M_{m \times n}(\mathbb{F})$  via a row operation. Then, for all  $a_1, \ldots, a_n \in \mathbb{F}$ ,

$$a_1 A^{(1)} + \dots + a_n A^{(n)} = \vec{0} \iff a_1 B^{(1)} + \dots + a_n B^{(n)} = \vec{0}.$$

In particular, columns in A are linearly (in)dependent iff the corresponding columns in B are linearly (in)dependent.

*Proof.* Left as a (homework) exercise.

#### **← Lemma 3.2**

Let *B* be the reduced row echelon form of  $A \in M_{m \times n}(\mathbb{F})$ . Then:

- 1.  $\sharp$  non-zero rows of  $B = \operatorname{rank}(B) = \operatorname{rank}(A) =: r$ .
- 2. For each i = 1, ..., r, denote by  $j_i$  the pivot of the ith row. Then,  $B^{(j_i)} = e_i \in \mathbb{F}^m$ . In particular,  $\{B^{(j_1)}, ..., B^{(j_r)}\}$  is linearly independent.
- 3. Each column of *B* without a pivot is in the span of the previous columns.

*Proof.* Follows from the definition of rref.

## 

The rref of a matrix is unique.

*Proof.* Left as a (homework) exercise.

← Lecture 23; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### 3.3 Determinant

The determinant, denoted det(A), of a square matrix  $A \in M_n(\mathbb{F})$  is a scalar from  $\mathbb{F}$ , meant to equal 0 iff A is not invertible.

#### **→ Proposition 3.5**

 $A \in M_n(\mathbb{F})$  is invertible  $\iff$  the columns of A are linearly independent  $\iff$  the rows of A are linearly independent  $\iff$  rank(A) = n

<u>Proof.</u> A invertible  $\iff$   $L_A$  invertible  $\iff$   $L_A$  bijection  $\iff$   $L_A$  surjection  $\iff$  rank $(L_A) = \text{rank}(A) = n$ 

### **⊗ Example 3.3**

Let 
$$A \in M_3(\mathbb{R})$$
,  $A = \begin{pmatrix} - & v_1 & - \\ - & v_2 & - \\ - & v_3 & - \end{pmatrix}$ . If  $\{v_1, v_2, v_3\}$  linear dependent, then  $\dim(\mathrm{Span}(v_1, v_2, v_3)) \leq 2$ ,

which happens iff the parallelepiped formed with sides  $v_1, v_2, v_3$  is contained in a plane (is "flat"), iff the parallelepiped is a parallelogram, ie, has 0 volume. As such, we can make the notion of volume dependent on the orientation of  $v_1, v_2, v_3$  such that permuting  $v_1, v_2, v_3$  changes the sign of the volume. This gives us the idea of an "oriented volume", which we can define as our determinant. This has a clear meaning in  $\mathbb{R}$ , but it remains to show how we can generalize this to arbitrary fields, where such a "volume" does not have a concrete meaning.

We now aim to derive a general formula for the determinant of a matrix over an arbitrary field by observing several key characteristics of our parallelepiped constructed above, and using these to define a unique determinant formula with geometric motivations.

#### Observation 1

Scaling a vector in a parallelepiped scales the volume of the parallelepiped by the same scalar.

## → **Definition** 3.5: multiinear form

A function  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  is called (row) multilinear, or n-linear, if it is linear in every row, i.e. for each i = 1, ..., n,

$$\delta \begin{pmatrix} - & v_{1} & - \\ \vdots & \vdots & - \\ - & v_{i-1} & - \\ - & c \cdot \vec{x} + \vec{y} & - \\ - & v_{i+1} & - \\ \vdots & - & v_{n} & - \end{pmatrix} = c \cdot \delta \begin{pmatrix} - & v_{1} & - \\ \vdots & \vdots & - \\ - & v_{i-1} & - \\ - & \vec{x} & - \\ - & v_{i+1} & - \\ \vdots & - & v_{n} & - \end{pmatrix} + \delta \begin{pmatrix} - & v_{1} & - \\ \vdots & - \\ - & v_{i-1} & - \\ - & \vec{y} & - \\ - & v_{i+1} & - \\ \vdots & - & v_{n} & - \end{pmatrix}.$$

## **⊗ Example 3.4**

1.  $\delta(A) := a_{11} \cdot a_{22} \cdot \cdots \cdot a_{nn}$  is *n*-linear.

- 2. Fix  $j \in \{1, ..., n\}$ . The function  $\delta_j(A) := a_{1j} \cdot a_{2j} \cdot ... \cdot a_{nj}$  is n-linear.
- \*3. However,  $tr(A) := \sum_{i=1}^{n} a_{ii}$  is *not n*-linear; scalar multiplication fails.

### **→ Proposition 3.6**

For an *n*-linear form  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$ , if  $A \in M_n(\mathbb{F})$  has zero row, then  $\delta(A) = 0$ .

$$\underline{Proof.} \ \delta(A) = \delta\left(\begin{pmatrix}\vec{0}\\ \vdots\end{pmatrix}\right) = \delta\left(\begin{pmatrix}\vec{0}\\ \vdots\end{pmatrix}\right) + \begin{pmatrix}\vec{0}\\ \vdots\end{pmatrix}\right) = \delta\left(\begin{pmatrix}\vec{0}\\ \vdots\end{pmatrix}\right) + \delta\left(\begin{pmatrix}\vec{0}\\ \vdots\end{pmatrix}\right) = \delta(A) + \delta(A) \implies \delta(A) = 0.$$

#### Observation 2

*If two sides of the parallelepiped are equal, then the volume is 0 (the shape is "flat").* 

#### → **Definition** 3.6: Alternating

A *n*-linear form  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  is called *alternating* if  $\delta(A) = 0$  for any matrix A whose two equal rows.

### **→ Proposition 3.7**

Let  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  be an alternating n-linear form. Then, if B is obtained from A by swapping two rows, then  $\delta(B) = -\delta(A)$ .

<u>Proof.</u> It suffices to show that swapping two consecutive rows changes the sign of the result. Suppose *B* is obtained from *A* by swapping rows 1 and 2, namely

$$B = \begin{pmatrix} - & A_{(2)} & - \\ - & A_{(1)} & - \\ & \vdots & \end{pmatrix}.$$

Then,

$$\delta \begin{pmatrix} - & A_{(1)} + A_{(2)} & - \\ - & A_{(1)} + A_{(2)} & - \\ & \vdots & - \end{pmatrix} = 0,$$

since its first two rows are equal; OTOH,

$$\delta \begin{pmatrix} - & A_{(1)} + A_{(2)} & - \\ - & A_{(1)} + A_{(2)} & - \\ & \vdots & - \end{pmatrix} = \delta(A) + \delta(B),$$

so 
$$\delta(B) = -\delta(A)$$
.

#### **→ Proposition 3.8**

A multilinear form  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  is alternating  $\iff \delta(A) = 0$  for every matrix A with two equal consecutive rows.

*Proof.* Left as a (homework) exercise.

#### **Observation 3**

If  $v_i = e_i$  for i = 1, ..., n, ie, our parallelepiped is the unit cube, then the volume, aptly, equals 1; it is "normalized".

← Lecture 24; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### **→ Proposition 3.9**

Let  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  be an alternating multilinear form. Then, for each matrix  $A := (a_{ij}) \in M_n(\mathbb{F})$ , we have

$$\delta(A) = \sum_{\pi \in S_n} a_{1\pi(1)} a_{2\pi(2)} \cdots a_{n\pi(n)} \delta(\pi I),$$

where

$$\pi I_n := \begin{pmatrix} - & e_{\pi(1)} & - \\ & \vdots & \\ - & e_{\pi(n)} & - \end{pmatrix}.$$

Proof. Left as a (homework) exercise.

**Remark 3.3.** Since  $\delta$  alternating, we can use row swaps to bring any  $\pi I_n$  to  $I_n$ , thus  $\delta(\pi I_n) = \pm \delta(I_n)$ ;  $\pm$  depends on the number of row swaps needed, ie, the parity of the given permutation  $\pi$ .

## **○** Definition 3.7: Parity

For a permutation  $\pi \in S_n$ , we let  $\sharp \pi :=$  number of inversions = number of pairs  $i, j \in \{1, ..., n\}$  such that i < j but  $\pi(i) > \pi(j)$ . We say  $\pi$  even (resp. odd) if  $\sharp \pi$  even (resp. odd), and define  $\operatorname{sgn}(\pi) := (-1)^{\sharp \pi}$  the sign of  $\pi$ .

## **←** Proposition 3.10

sgn :  $S_n \to (\{1, -1\}, \cdot)$  is a group homomorphism, that is -1 of transpositions. In particular,

- 1.  $\operatorname{sgn}(\pi^{-1}) = \operatorname{sgn}(\pi)$
- 2. If  $\pi$  a product of k transpositions,  $\tau_1 \cdot \tau_2 \cdots \tau_k$ , then  $k = \sharp \pi \mod 2$ .

Proof. See Goren, Lemma 4.2.1.

For (a), we have that  $sgn(\pi^{-1}) = sgn(\pi)^{-1} = sgn(\pi)$ .

For (b),  $sgn(\pi) = sgn(\tau_1 \cdots \tau_k) = sgn(\tau_1) \cdots sgn(\tau_k) = (-1)^k so (-1)^{\sharp \pi} = (-1)^k$  and thus  $k = \sharp \pi \mod 2$ .

### **Corollary 3.11:** Of proposition 3.9

For any alternating multilinear form  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  and  $A := (a_{ij}) \in M_n(\mathbb{F})$ ,

$$\delta(A) = \sum_{\pi \in S_n} a_{1\pi(1)} \cdots a_{n\pi(n)} \cdot \operatorname{sgn}(\pi) \cdot \delta(I_n).$$

In particular,  $\delta$  is uniquely determined by its value on  $I_n$ .

<u>Proof.</u> By proposition 3.9,  $\delta(A) = \sum_{\pi \in S_n} a_{1\pi(1)} \cdots a_{n\pi(n)} \delta(\pi I_n)$ , so we need only to show that  $\delta(\pi I_n) = \operatorname{sgn}(\pi) \cdot \overline{\delta(I_n)}$ . Writing  $\pi^= \tau_1 \cdots \tau_k$  as transpositions, we know that  $(-1)^k = \operatorname{sgn}(\pi)$  and each row swap corresponding to a  $\tau_i$  changes the sign of  $\delta$ . Applying each  $\tau_i$  row swaps to  $I_n$ , we obtain  $\pi I_n$  and thus  $\delta(\pi I_n) = (-1)^k \cdot \delta(I_n) = \operatorname{sgn}(\pi) \cdot \delta(I_n)$ .

#### → Theorem 3.7: Characterization of the Determinant

There is a *unique* normalized (ie is 1 on  $I_n$ ) alternating multilinear form; we call such a form the *determinant* and denote det; namely,

$$\det(A) := \sum_{\pi \in S_n} \operatorname{sgn}(\pi) \cdot a_{1\pi(1)} \cdots a_{n\pi(n)}.$$

<u>Proof.</u> Uniqueness follows from corollary 3.11. It remains to show that the given definition for det is a normalized, alternating, multilinear form.

Normalized:  $\det(I_n) = \sum_{\pi \in S_n} \operatorname{sgn}(\pi) \cdot a_{1\pi(1)} \cdots a_{n\pi(n)} = (-1)^0 \cdot 1 \cdots 1 = 1$ , since each summand will be zero for any permutation other than the identity.

Multilinear: A linear combination of n-linear forms is itself an n-linear form, so it suffices to prove that for a fixed  $\pi \in S_n$ ,  $\delta_\pi : M_n(\mathbb{F}) \to \mathbb{F}$  given by  $\delta_\pi(A) := a_{1\pi(1)} \cdots a_{n\pi(n)}$  is n-linear, which should be clear as a product of matrix entries.

Alternating: Suppose A has two equal rows, wlog  $A_{(1)}$ ,  $A_{(2)}$ . We partition  $S_n$  into the disjoint union of even and odd permutations, denoting  $A_n$  the even permutations. Note that  $S_n \setminus A_n = A_n \cdot (12)$ , ie the coset of the transposition (12) of the subgroup  $A_n$ . Thus,  $A_n \to A_n \cdot (12)$  via  $\pi \mapsto \pi' := \pi \cdot (12)$  is a bijection, and our

partition has two equal parts. Thus, we can rewrite det as

$$\begin{aligned} \det(A) &= \sum_{\pi \in S_n} \operatorname{sgn}(\pi) \cdot a_{1\pi(1)} \cdots a_{n\pi(n)} \\ &= \sum_{\pi \in A_n} \operatorname{sgn}(\pi) a_{1\pi(1)} \cdots a_{n\pi(n)} + \sum_{\pi \in A_n} \underbrace{\operatorname{sgn}(\pi')}_{=-\operatorname{sgn}(\pi)} \underbrace{a_{1\pi'(1)}}_{a_{1\pi(2)}} \cdots \underbrace{a_{n\pi'(n)}}_{=a_{n\pi(n)}} \\ &= \sum_{\pi \in A_n} \operatorname{sgn}(\pi) a_{1\pi(1)} \cdots a_{n\pi(n)} - \sum_{\pi \in A_n} \operatorname{sgn}(\pi) a_{1\pi(1)} \cdots a_{n\pi(n)} = 0, \end{aligned}$$

where the last line follows from  $a_{1\pi(2)} = a_{2\pi(2)}$  and conversely  $a_{2\pi(1)} = a_{1\pi(1)}$  by assumption, and thus the two partitioned summands are equal, of opposite sign.

#### 3.3.1 Properties of the Determinant

#### **← Lemma 3.3**

Let  $\delta: M_n(\mathbb{F}) \to \mathbb{F}$  be an alternating multilinear form. Then, for  $A \in M_n(\mathbb{F})$  and an elementary matrix E, if E is of type

- 1. 1, then  $\delta(E \cdot A) = -\delta(A)$ ;
- 2. 2, representing multiplying by a scalar  $c \in \mathbb{F}$ , then  $\delta(E \cdot A) = c\delta(A)$ ;
- 3. 3, then  $\delta(E \cdot A) = \delta(A)$ .

*Proof.* 1. is a restatement of the alternating property, proposition 3.7, 2. is the definition of multilinearity.

For 3., suppose E adds  $c \cdot \text{row } i$  to row j, and suppose wlog i = 1, j = 2. Then,

$$\delta(E \cdot A) = \delta(A_{(1)}, A_{(2)} + c \cdot A_{(1)}, A_{(3)}, \dots, A_{(n)}) = \delta(A) + c \cdot \delta(A_{(1)}, A_{(1)}, A_{(3)}, \dots, A_{(n)}) = \delta(A),$$

by definition of  $\delta$  being alternating.

#### $\hookrightarrow$ Theorem 3.8

For  $A \in M_n(\mathbb{F})$ , det(A) = 0 iff A noninvertible.

*Proof.* Let  $E_1, ..., E_k$  be elementary matrices such that  $A' := E_1 ... E_k \cdot A$  is in rref, remaring that then  $\det(A') = \overline{c \cdot \det(A)}$  for some  $c \in \mathbb{F}$ ,  $c \neq 0$ , by lemma 3.3. We also have that  $\operatorname{rank}(A) = \operatorname{rank}(A')$ , and  $\operatorname{rank}(A') < n \iff A'$  has a zero row.

( $\iff$ ) if A' has a zero row, then by multilinearity,  $\det(A') = 0$  and thus  $\det(A) = 0$  as well.

 $(\Longrightarrow)$  if A' has no zero row, then  $A'=I_n$  and thus  $\det(A')=1$ , and  $\det(A)=c^{-1}\cdot 1\neq 0$ .

#### $\hookrightarrow$ Theorem 3.9

The determinant respects products,  $det(A \cdot B) = det(A) \cdot det(B)$ , for all  $A, B \in M_n(\mathbb{F})$ .

*Proof.* Suppose first A noninvertible, so rank(A) < n and det(A) = 0. Then

$$rank(A \cdot B) = rank(L_{AB}) = rank(L_A \circ L_B) \le rank(L_A) = rank(A) < n,$$

so  $A \cdot B$  also noninvertible and  $\det(A \cdot B) = 0$ . Hence,  $\det(A) \cdot \det(B) = 0 \cdot \det(B) = 0 = \det(A \cdot B)$ .

Suppose now A invertible. Then, writing  $A = E_1 \cdots E_k$  as a product of elementary matrices; it suffices to show, by induction, for a single E. By lemma 3.3,  $\det(A) = \det(E \cdot I) = c$  for some non-zero constant  $c \in \mathbb{F}$ , so  $\det(A) \cdot \det(B) = c \cdot \det(B)$ . On the other hand,  $\det(A \cdot B) = \det(E \cdot B) = c \cdot \det(B)$ , also by lemma 3.3.

### 

 $\det(A^{-1}) = \det(A)^{-1}, \forall A \in GL_n(\mathbb{F}).$ 

*Proof.* 
$$1 = \det(I_n) = \det(A \cdot A^{-1}) = \det(A) \cdot (A^{-1}) \implies \det(A^{-1}) = \det(A)^{-1}$$
.

#### **←** Corollary 3.13

 $\det(A^t) = \det(A) \,\forall \, A \in M_n(\mathbb{F}).$ 

*Proof.* If *A* noninvertible, then  $rank(A^t) = rank(A) < n$  so both are noninvertible, and thus  $det(A^t) = det(A) = 0$ .

If A invertible, writing  $A = E_1 \cdots E_k$ , we have  $A^t = E_k^t \cdots E_1^t$ . For each i = 1, ..., k,  $E_i^t$  is an elementary matrix of the same type, with the same constant if of type 2, and thus  $\det(E_i) = \det(E_i^t)$ , and so

$$\det(A^t) = \det(E_k^t) \cdots \det(E_1^t) = \det(E_1) \cdots \det(E_k) = \det(A).$$

 $\hookrightarrow Lecture~25; Last~Updated:~Mon~Mar~25~15:44:55~EDT~2024$ 

## 4 Diagonalization of Linear Operators

#### 4.1 Introduction

This section will be concerned with decomposing a linear operator  $T: V \to V$  for a finite dimensional V into a direct sum of simpler linear operators.

The simplest linear operator we could consider is multiplication by a fixed scalar; ideally, then, we would like to be able, for any operator  $T: V \to V$ , to decompose  $V = V_1 \oplus V_2 \oplus \cdots \oplus V_k$  of T-invariant subspaces such that  $T|_{V_i}$  is just multiplication by some scalar  $\lambda_i$ .

### → Definition 4.1: Linearly Independent Subspaces

For subspaces  $V_1, V_2, \ldots, V_k \subseteq V$ , we say that  $\{V_1, \ldots, V_k\}$  is linearly independent if

$$V_i \cap \sum_{j \neq i} V_j = \{0_V\},\,$$

then, we call  $V_1 + V_2 + \cdots + V_k$  a *direct sum* and denote  $V_1 \oplus V_2 \oplus \cdots \oplus V_k$ .

### → **Definition** 4.2: Diagonalization

Call a linear operator  $T: V \to V$  diagonalizable if it admits a diagonalization, ie

$$V = V_1 \oplus V_2 \oplus \cdots \oplus V_k,$$

where each  $V_i$  is a subspace of V, such that  $T|_{V_i}$  is just multiplication by a fixed scalar  $\lambda_i \in \mathbb{F}$ .

### **⊗ Example 4.1**

- 1. If A a diagonal matrix,  $A = \begin{pmatrix} \lambda_1 & 0 & \cdots \\ 0 & \ddots & 0 \\ \cdots & 0 & \lambda_n \end{pmatrix}$ , then  $L_A$  is diagonalizable; take  $V_i := \operatorname{Span}(\{e_i\})$ , then  $\mathbb{F}^n = V_1 \oplus \cdots \oplus V_n$ .
- 2. If A not diagonal, but is similar to a diagonal matrix D as above ie  $\exists Q \in GL_n(\mathbb{F})$  s.t.  $A = QDQ^{-1}$ . Then, as any invertible matrix  $Q = [I_n]_{\alpha}^{\beta}$  is a change of basis matrix, denoting  $\beta := \{v_1, \ldots, v_n\}$ , then letting  $V_i := \operatorname{Span}(\{v_i\})$  gives the appropriate decomposition such that  $L_A|_{V_i} = \operatorname{mult.}$  by  $\lambda_i$ . We generalize this below.

## **→ Proposition 4.1**

Let V,  $\dim(V) < \infty$ . A linear operator  $T: V \to V$  is diagonalizable iff there is a basis  $\beta$  for V such that  $[T]^{\beta}_{\beta}$  is diagonal.

*Proof.* ( $\Longrightarrow$ ) Suppose  $V = V_1 \oplus \cdots \oplus V_k$  such that  $T|_{V_i} = \text{mult.}$  by  $\lambda_i$ . Let  $\beta_i$  be a basis for  $V_i$ , then,  $\beta := \bigcup_{i=1}^k \beta_i$ 

is a basis for V. Then, for each  $v \in \beta$ ,  $v \in \beta_i$  for some i and so  $T(v) = \lambda_i \cdot v$  and thus  $[T(v)]_{\beta} = \begin{pmatrix} 0 \\ \vdots \\ \lambda_i \\ \vdots \\ 0 \end{pmatrix}$ , and so

$$[T]_{\beta} = \begin{pmatrix} \lambda_1 & & \\ & \ddots & \\ & & \lambda_n \end{pmatrix}.$$

(  $\iff$  ) Suppose  $\beta := \{v_1, \dots, v_n\}$  a basis such that  $[T]_\beta$  is diagonal. Then, taking  $V_i := \text{Span}(\{v_i\})$ ,  $[T(v_i)] = \lambda_i \cdot e_i = \lambda_i \cdot [v_i]_\beta = [\lambda_i v_i]_\beta$ .  $v \mapsto [v]_\beta$  injective, and thus  $Tv_i = \lambda_i v_i$ .

## 4.2 Eigenvalues/vectors/spaces

#### → Definition 4.3: Eigenvalue/eigenvector

For a linear operator  $T: V \to V$  and  $\lambda \in \mathbb{F}$ ,  $\lambda$  is called an *eigenvalue* of T if there is a non-zero vector  $v \in V$  such that  $T(v) = \lambda \cdot v$ . Then, v is called an *eigenvector*.

← Lecture 26; Last Updated: Mon Mar 25 13:48:03 EDT 2024

### $\hookrightarrow$ Proposition 4.2

For a finite dimensional vector space V and a linear transformation  $T: V \to V$ , TFAE:

- 1. T is diagonalizable, ie  $V = \bigoplus_{i=1}^{k} V_i$  s.t.  $T|_{V_i}$  scalar multiplication for each i.
- 2. There is a basis  $\beta$  for V such that  $[T]^{\beta}_{\beta}$  is diagonal.
- 3. There is a basis  $\beta$  consisting of eigenvectors of T.

*Proof.* (1.  $\iff$  2.) proposition 4.1.

(2.  $\Longrightarrow$  3.) Suppose  $\beta := \{v_1, \dots, v_n\}$  a basis such that  $[T]_\beta$  a diagonal matrix with entries  $\lambda_i$ . Then,  $[T(v_j)]_\beta = \lambda_j e_j$  so  $T(v_j) = \lambda_j v_j$  and thus  $v_j$  an eigenvector.

(3.  $\Longrightarrow$  2.) Let  $\beta := \{v_1, \dots, v_n\}$  a basis of eigenvectors such that  $T(v_j) = \lambda_j v_j$  for some  $\lambda_j \in \mathbb{F}$ . Then

$$[T]_{\beta} = \begin{pmatrix} | & | & | \\ [T(v_1)]_{\beta} & [T(v_2)]_{\beta} & \cdots & [T(v_n)]_{\beta} \\ | & | & | \end{pmatrix}$$

But  $[T(v_i)]_{\beta} = [\lambda_i v_j]_{\beta} = \lambda_j e_j$ , so this matrix is diagonal with entries  $\lambda_j$ .

### **←** Proposition 4.3

For  $A \in M_n(\mathbb{F})$ , A is diagonalizable, ie  $L_A$  diagonalizable,  $\iff \exists Q \in GL_n(\mathbb{F}) \text{ s.t. } Q^{-1}AQ$  is diagonal; the columns of Q are eigenvectors, forming a basis for  $\mathbb{F}^n$ .

<u>Proof.</u> A diagonalizable  $\iff$  there is a basis  $\beta$  for  $\mathbb{F}^n$  such that  $[L_A]_{\beta}$  diagonal. Then, letting  $\alpha$  be the standard basis, we have that  $A = [L_A]_{\alpha} = [I]_{\beta}^{\alpha} \cdot [L_A]_{\beta} \cdot [I]_{\alpha}^{\beta} = [I]_{\beta}^{\alpha} \cdot [L_A]_{\beta} \cdot ([I]_{\beta}^{\alpha})^{-1}$  so  $[L_A]_{\beta} = ([I]_{\beta}^{\alpha})^{-1} \cdot A \cdot [I]_{\beta}^{\alpha}$ . Letting  $Q := [I]_{\beta}^{\alpha}$ , we get  $Q^{-1}AQ$  diagonal. The columns of Q are exactly the vectors in  $\beta$ , and thus eigenvectors.

### **○ Definition** 4.4: Eigenspace

For an eigenvalue  $\lambda$  of  $T:V\to V$ , let  $\mathrm{Eig}_V(\lambda):=\{v\in V:Tv=\lambda v\}$ , called the *eigenspace* of T corresponding to  $\lambda$ .

### **←** Proposition 4.4

 $\operatorname{Eig}_V(\lambda)$  a subspace of V.

**Remark 4.1.** Diagonalizability is a conjugate-invariant property; if  $A \sim B$  and A diagonalizable, then so is B.

### **→ Proposition 4.5**

The trace, tr, and determinant, det, functions  $M_n(\mathbb{F}) \to \mathbb{F}$  are conjugation-invariant.

## **□** Definition 4.5

Let V,  $\dim(V) = n$ . and  $T: V \to V$  a linear operator. Define tr (resp. det) of T as  $\operatorname{tr}(T) := \operatorname{tr}([T]_{\beta})$  ( $\det(T) : \det([T]_{\beta})$ ) for some/any basis  $\beta$  for V.

**Remark 4.2.** This is well-defined (doesn't depend on the choice of basis),  $[T]_{\alpha}$ ,  $[T]_{\beta}$  are conjugate for any two bases, and tr, det are conjugate-invariant.

## **→ Proposition 4.6**

 $\dim(V) = n, T : V \to V \text{ invertible } \iff \det(T) \neq 0.$ 

*Proof.* T invertible  $\iff$   $[T]_{\beta}$  invertible  $\iff$   $\det([T]_{\beta}) \neq 0$  for some basis  $\beta$ .

### **→ Proposition 4.7**

Let  $T: V \to V$ ,  $\dim(V) < \infty$ .

- 1.  $v \in V$  an eigenvector of T with eigenvalue  $\lambda \iff v \in \text{Ker}(\lambda I T)$ .
- 2.  $\lambda \in \mathbb{F}$  an eigenvalue  $\iff \lambda I T$  non-invertible  $\iff \det(\lambda I T) = 0$ .

*Proof.* 1.  $T(v) = \lambda v \iff \lambda v - T(v) = 0 \iff (\lambda I_V - T)(v) = 0 \iff v \in \text{Ker}(\lambda I_V - T).$ 

2. follows from 1. by the dimension theorem.

← Lecture 27; Last Updated: Mon Mar 25 13:48:03 EDT 2024

### $\hookrightarrow$ Corollary 4.1

For  $A \in M_n(\mathbb{F})$ ,  $\lambda \in \mathbb{F}$  an eigenvalue of A (that is, if  $L_A$ )  $\iff$   $\det(\lambda I - A) = 0$ .

*Proof.* Follows from the previous proposition by noting that  $[\lambda I_{\mathbb{F}^n} - L_A]$  in the standard basis of  $\mathbb{F}^n$  is just  $\overline{\lambda I_n} - A$ .

### **←** Proposition 4.8

1. For  $A \in M_n(\mathbb{F})$ , the function  $t \mapsto \det(tI_n - A)$  is a polynomial in t of the form

$$p_A(t) := t^n - tr(A)t^{n-1} + \dots + (-1)^n \det(A)$$

and is called the *characteristic polynomial* of *A*.

2. For a *n*-dim *V* and  $T: V \to V$ , the function  $t \mapsto \det(tI_V - T)$  is a polynomial of the form

$$p_T(t) := t^n - \operatorname{tr}(T)t^{n-1} + \dots + (-1)^n \operatorname{det}(T).$$

Proof. 1. a homework exercise; 2. follows immediately.

Hence, this proposition gives that the eigenvalues of A are precisely the roots of  $p_A(t)$ .

## **←** Corollary 4.2

 $T: V \rightarrow V$  has at most n distinct eigenvalues.

## **⊗ Example 4.2**

Let 
$$A := \begin{pmatrix} 3 & 1 & 0 \\ 0 & 3 & 4 \\ 0 & 0 & 4 \end{pmatrix}$$
. Then

$$-p_A(t) = \det(A - tI_n) = \det\begin{pmatrix} 3 - t & 1 & 0 \\ 0 & 3 - t & 4 \\ 0 & 0 & 4 - t \end{pmatrix} = (3 - t)^2 (4 - t),$$

with roots t = 3, 4 and thus A has two eigenvalues  $\lambda_1 := 3$  mult. 2 and  $\lambda_2 := 4$ . Then:

$$\operatorname{Eig}_{A}(\lambda_{1}) = \operatorname{Ker}(3I - L_{A}) = \{\vec{x} \in \mathbb{F}^{3} : (A - 3I)\vec{x} = 0\},\$$

hence,  $\vec{x} \in \text{Eig}_A(\lambda_1)$  are the solutions to the homogeneous system  $(A - 3I)\vec{x} = 0$ :

$$\begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 4 \\ 0 & 0 & 1 \end{pmatrix} \cdot \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \iff \begin{cases} x_2 = 0 \\ x_3 = 0 \end{cases} \iff \vec{x} = ae_1, a \in \mathbb{F},$$

so  $\operatorname{Eig}_A(3) = \operatorname{Span}(\{e_1\})$ . A similar computation gives  $\operatorname{Eig}_A(\lambda)(2) = \operatorname{Span}(\{(1,1,\frac{1}{4})\})$ .

We have hence found two 1-dimensional eigenspaces; *A* is thus not diagonalizable.

## **→ Proposition 4.9**

Let  $\lambda_1, \ldots, \lambda_k$  be distinct eigenvalues of  $T: V \to V$  on V n-dim. Then if  $v_i$  an eigenvector of T corresponding to  $\lambda_i$ , then  $\{v_1, \ldots, v_k\}$  is linearly independent. In particular,  $k \le n$ .

<u>Proof.</u> By induction on k. If k = 1 then  $\{v_1\}$  is linear independent because  $v_1 \neq 0_V$ . Suppose the proposition holds for k. Let  $\lambda_1, \ldots, \lambda_{k+1}$  be distinct eigenvalues with corresponding  $\{v_1, \ldots, v_{k+1}\}$  eigenvectors. Let

Taking T(1), we have

Then,  $\bigcirc -\lambda_{k+1} \cdot \bigcirc$  yields

$$(\lambda_1 - \lambda_{k+1})a_1v_1 + \cdots + (\lambda_k - \lambda_{k+1})a_kv_k = 0_V,$$

but  $v_1, \ldots, v_k$  linearly independent by assumption, so  $(\lambda_i - \lambda_{k+1})a_i = 0$  for  $i = 1, \ldots, k$ . The  $\lambda_i$ 's distinct, hence it must be that  $a_i = 0$  for  $i = 1, \ldots, k$ , and so ① gives that  $a_{k+1}v_{k+1} = 0_V$ . But  $v_{k+1}$  an eigenvalue, so this is only possible if  $a_{k+1} = 0$  and the proof is complete.

#### **Corollary 4.3**

For distinct eigenvalues  $\lambda_1, \ldots, \lambda_k$  of  $T: V \to V$ ,  $\dim(V) < \infty$ , the corresponding eigenspaces  $\operatorname{Eig}_T(\lambda_i)$  are linearly independent.

*Proof.* This follows directly proposition 4.9.

#### → Definition 4.6: Geometric Multiplicity

For eigenvalue  $\lambda$  of  $T: V \to V$ , denote by  $m_g(\lambda) := \dim(\operatorname{Eig}_T(\lambda))$  and call it the *geometric multiplicity* of  $\lambda$ .

### **Corollary 4.4**

For  $T: V \to V$  with distinct eigenvalues  $\lambda_1, \ldots, \lambda_k$ ,

$$\sum_{i=1}^k m_g(\lambda_i) \leqslant n.$$

<u>Proof.</u>  $\sum_{i=1}^k m_g(\lambda_i) = \dim(\bigoplus_{i=1}^k \operatorname{Eig}_T(\lambda_i)) \le n.$ 

← Lecture 28; Last Updated: Mon Mar 25 13:48:03 EDT 2024

#### $\hookrightarrow$ Theorem 4.1

Let  $V, n := \dim(V)$ . A linear operator  $T: V \to V$  is diagonalizable iff the sum of the geometric multiplicities of all of the eigenvalues  $\lambda_1, \ldots, \lambda_k$  equals n, ie iff

$$\sum_{i=1}^k m_{\mathcal{S}}(\lambda_i) = n.$$

*Proof.* Recall that T diagonalizable iff  $\exists$  a basis consisting of eigenvectors.

 $(\Longrightarrow)$  If  $\beta:=\{v_1,\ldots,v_n\}$  a basis for V of eigenvectors, then each  $v_i\in \mathrm{Eig}_T(\lambda_j)$  for some j, so  $\beta\subseteq \cup_{i=1}^k\mathrm{Eig}_T(\lambda_i)$  and  $\beta\cap \mathrm{Eig}_T(\lambda_i)$  is linearly independent, hence  $|\beta\cap \mathrm{Eig}_T(\lambda_i)|\leqslant m_g(\lambda_i)$ . Thus,  $n=|\beta|=\sum_{i=1}^k\left|\beta\cap \mathrm{Eig}_T(\lambda_i)\right|\leqslant \sum_{i=1}^km_g(\lambda_i)$ . By the previous corollary, it follows that  $\sum_{i=1}^km_g(\lambda_i)=n$ .

( $\iff$ ) Suppose  $\sum_{i=1}^k m_g(\lambda_i) = n$  and let  $\beta_i$  a basis for  $\operatorname{Eig}_T(\lambda_i)$ . By the linear independence of the eigenspaces,  $\beta := \bigcup_{i=1}^k \beta_i$  still linearly independent and, having n elements, is a basis for V consisting of eigenvectors by construction.

### **⊗ Example 4.3**

Let  $D : \mathbb{F}[t]_2 \to \mathbb{F}[t]_2$  by  $p(t) \mapsto p'(t)$ . To find eigenvalues of D, we fix the basis  $\alpha := \{1, t, t^2\}$  for D

and find the corresponding matrix representation

$$[D]_{\alpha} = \begin{pmatrix} | & | & | \\ [D(1)]_{\alpha} & [D(t)]_{\alpha} & [D(t^{2})]_{\alpha} \end{pmatrix} = \begin{pmatrix} | & | & | \\ [0]_{\alpha} & [1]_{\alpha} & [2t]_{\alpha} \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 2 \\ 0 & 0 & 0 \end{pmatrix}.$$

Thus,

$$p_D(t) = -\det([D]_{\alpha} - tI_3) = -\begin{pmatrix} -t & 1 & 0 \\ 0 & -t & 2 \\ 0 & 0 & -t \end{pmatrix} = t^3,$$

hence, the only eigenvalue is  $\lambda=0$ , with corresponding  $\mathrm{Eig}_D(0)=\mathrm{Ker}(D-0\cdot I)=\mathrm{Ker}(D)$ , so  $m_g(0)=\mathrm{dim}(\mathrm{Ker}(D))=3-\mathrm{rank}(D)=3-\mathrm{rank}([D]_\alpha)=1.$  Moreover, D is not diagonalizable.

### → **Definition** 4.7: Algebraic Multiplicity

For V,  $\dim(V) < \infty$ , and a linear operator  $T: V \to V$  and an eigenvalue  $\lambda$  of T, we define the *algebraic* multiplicity of  $\lambda$  to be the multiplicity of  $\lambda$  as the root of  $p_T(t)$ , ie the largest  $k \ge 1$  such that  $(t - \lambda)^k \mid p_T(t)$ . We denote this by

$$m_a(\lambda)$$
.

#### → Lemma 4.1

Let V,  $\dim(V) < \infty$  and  $T : V \to V$  be linear. For each T-invariant subspace  $W \subseteq V$ , let  $T_W := T|_W : W \to W$ . Then,

$$p_{T_W}(t) \mid p_T(t).$$

*Proof.* Let  $\alpha := \{v_1, \ldots, v_k\}$  be a basis for W and extend it to a basis  $\beta := \alpha \cup \{v_{k+1}, \ldots, v_n\}$  for V. Leting  $\overline{A} := [T_W]_{\alpha}$ , we see that

$$[T]_{\beta} = \begin{pmatrix} | & | & | & | \\ [T(v_1)]_{\beta} & \cdots & [T(v_k)]_{\beta} & [T(v_{k+1})]_{\beta} & \cdots & [T(v_n)]_{\beta} \\ | & | & | & | & | \\ A & \star & \star & \\ & \bullet & \star & \\ \end{pmatrix},$$

where **0** is a  $n - k \times k$  matrix of zeros. Hence,

$$p_T(t) = -\det([T]_{\beta} - tI_n) = -\det(\cdots) = -\det(A - tI_k) \cdot \det(B - tI_{n-k}) = -p_{T_W}(t)\det(B - tI_{n-k}),$$

and the proof is complete.

#### **→ Proposition 4.10**

Let V, dim $(V) < \infty$ , and  $T : V \to V$ . For each eigenvalue  $\lambda$  of T,  $m_g(\lambda) \le m_a(\lambda)$ .

Proof. Let  $W := \operatorname{Eig}_T(\lambda)$ , which is T-invariant, so by lemma 4.1,  $p_T(t) = p_{T_W}(t) \cdot q(t)$  for some  $q(t) \in \mathbb{F}[t]$ . But, fixing any basis  $\alpha := \{v_1, \ldots, v_k\}$  for W, we have that  $T_W(v_i) = T(v_i) = \lambda v_i$  so  $[T(v_i)]_{\alpha} = \lambda e_i \in \mathbb{F}^k$  hence  $[T_W]_{\alpha}$  is just a  $k \times k$  diagonal matrix with  $\lambda$  entries. Thus,  $p_{T_W}(t) = \det(tI_k - [T_W]_{\alpha}) = (t - \lambda)^k$ , and so  $p_T(t) = (t - \lambda)^k \cdot q(t)$  and thus  $m_a(\lambda) \ge k = \dim(W) = m_g(\lambda)$ .

#### **○→ Definition 4.8: Splits**

A polynomial  $p(t) \in \mathbb{F}[t]$  *splits* over  $\mathbb{F}$  if  $p(t) = a \cdot (t - r_1) \cdots (t - r_n)$  for some  $a \in \mathbb{F}$ ,  $r_1, \ldots, r_n \in \mathbb{F}$ .

**Remark 4.3.** *If*  $\mathbb{F}$  *is algebraically closed, then every polymomial over*  $\mathbb{F}$  *splits over*  $\mathbb{F}$ .

**Remark 4.4.** For an eigenvalue  $\lambda$  of  $T: V \to V$ , where V is n-dimensional,  $p_T(t)$  splits iff  $\sum_{i=1}^k m_a(\lambda_i) = n$ .

### → Theorem 4.2: Main Criterion of Diagonalizability

Let V,  $\dim(V) < \infty$ ,  $T : V \to V$  linear. Then T diagonalizable iff  $p_T(t)$  splits and  $m_g(\lambda) = m_a(\lambda)$  for each eigenvalue  $\lambda$  of T.

*Proof.* Let  $\lambda_1, \ldots, \lambda_k$  be the distinct eigenvalues of T. Then,

$$T$$
 diagonalizable  $\iff \sum_{i=1}^k m_g(\lambda_i) = n := \dim(V)$ 

since  $m_g(\lambda_i) \leq m_a(\lambda_i)$  and  $\sum_{i=1}^k m_a(\lambda_i) \leq n$ , we have that

$$n = \sum_{i=1}^k m_g(\lambda_i) \iff m_g(\lambda_i) = m_a(\lambda_i), \quad i = 1, ..., k, \text{ and } \sum_{i=1}^k m_a(\lambda_i) = n,$$

but this last statement is equivalent to saying that  $p_T(t)$  splits.

← Lecture 29; Last Updated: Mon Mar 25 13:48:03 EDT 2024

### **⊗** Example 4.4

1. 
$$A := \begin{pmatrix} 4 & 0 & 1 \\ 2 & 3 & 2 \\ 1 & 0 & 4 \end{pmatrix}$$
, so  $L_A : \mathbb{F}^3 \to \mathbb{F}^3$ . Then,

$$p_A(t) = -\det\begin{pmatrix} 4-t & 0 & 1\\ 2 & 3-t & 2\\ 1 & 0 & 4-t \end{pmatrix} = -(4-t)(3-t)(4-t) + 1 \cdot (3-t) \cdot 2 = -(t-5)(t-3)^2.$$

Supposing char( $\mathbb{F}$ )  $\neq$  2 ie 3  $\neq$  5, then we have two distinct eigenvalues  $\lambda_1 = 5, \lambda_2 = 3$  with  $m_a(5) = 1, m_a(3) = 2$ , so the polynomial splits (regardless of  $\mathbb{F}$ ). We have that  $1 \leq m_g(5) \leq$  $m_a(5) = 1$ , so  $m_g(5) = m_a(5) = 1$ . We need only to check that  $m_g(3) = 2$ ; but we have that

$$m_g(3) = \text{nullity}(L_A - 3 \cdot I) = 3 - \text{rank}(L_A - 3 \cdot I) = 3 - \text{rank}(A - 3I)$$
  
=  $3 - \text{rank}\begin{pmatrix} 1 & 0 & 1 \\ 2 & 0 & 2 \\ 1 & 0 & 1 \end{pmatrix} = 3 - 1 = 2 = m_a(3),$ 

so A indeed diagonalizable. A conjugate of A that is diagonal is  $D := \begin{pmatrix} 3 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 2 \end{pmatrix}$ , and if  $v_1$  an eigenvector for  $\lambda_1 = 5$  and  $v_2, v_3$  are linearly independent eigenvectors for  $\lambda$ 

$$Q := \begin{pmatrix} | & | & | \\ v_1 & v_2 & v_3 \\ | & | & | \end{pmatrix} = [I_3]^{\alpha}_{\beta},$$

where  $\alpha := \{e_1, e_2, e_3\}$  and  $\beta := \{v_1, v_2, v_3\}$ , is such that

$$D = Q^{-1}AQ.$$

In the case that char( $\mathbb{F}$ ) = 2, 3 = 5 so we have a single eigenvalue  $\lambda$  = 1 = 3 = 5 with  $m_a(1)$  = 3.

But we still have that  $\operatorname{rank}(A - I) = \operatorname{rank}\begin{pmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 1 \end{pmatrix} = 1$  so  $m_g(1) = 2 < 3$ , hence A is not diagonalizable.

2. Let  $T: \mathbb{F}^2 \to \mathbb{F}^2$  be a rotation by ninety degrees, so  $T(e_1) = e_2$  and  $T(e_2) = -e_1$ . Then,  $T = L_A$ 

with

$$A = [T]_{\alpha} = \begin{pmatrix} | & | \\ e_2 & -e_1 \\ | & | \end{pmatrix} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix},$$

with  $\alpha$  the standard basis. Then

$$p_T(t) = p_A(t) = -\det\begin{pmatrix} -t & -1 \\ 1 & -t \end{pmatrix} = t^2 + 1,$$

which doesn't split over  $\mathbb{F} := \mathbb{R}$ , but does over  $\mathbb{F} := \mathbb{C}$  or any  $\mathbb{F}$  with characteristic 2 where  $t^2 + 1 = (t+1)^2$ .

When  $\mathbb{F} := \mathbb{C}$ ,  $p_T(t) = (t - i)(t + i)$  so we have 2 distinct eigenvalues with each having algebraic multiplicity 1, hence both have geometric multiplicity of 1 and thus T is diagonalizable.

When char( $\mathbb{F}$ ) = 2, we have a single eigenvalue  $\lambda$  = 1, with

$$m_g(1) = \text{nullity}(T - I) = 2 - \text{rank}(T - I) = 2 - \text{rank}\begin{pmatrix} -1 & -1 \\ 1 & -1 \end{pmatrix} = 2 - \text{rank}\begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} = 1 < 2 = m_a(1),$$

so *T* is not diagonalizable.

**Remark 4.5.** From the previous two examples, regard that the issue of diagonalizability is a field-related issue; not only because of the "splittability" of polynomials, but because of characteristic.

## 4.3 *T*-cyclic Vectors and the Cayley-Hamilton Theorem

## $\hookrightarrow$ **Definition** 4.9: *T*-cyclic subspace

Let *V* be any vector space,  $T: V \to V$  a linear operator, and  $v \in V$ . The *T-cyclic subspace* of/generated by v is the space

$$Span(\{v, T(v), T^2(v), ..., \}) = Span(\{T^n(v) : n \in \mathbb{N}\}).$$

**Remark 4.6.** Note that T-cyclic subspaces are T-invariant. In a sense, T-cyclic subspaces are "minimal T-invariant subspaces". Recall too that the characteristic polynomial of T restricted to T-invariant subspaces divides the characteristic polynomial of T by lemma 4.1.

#### **← Lemma 4.2**

§4.3

Let *V* be finite dimensional,  $T: V \to V$  linear, and  $v \in V$ . Let W := the *T*-cyclic subspace generated by v.

- 1.  $\{v, T(v), ..., T^{k-1}(v)\}\$  is a basis for W, where  $k := \dim(W)$ .
- 2. Since  $T^k(v) \in \text{Span}(\{v, T(v), \dots, T^{k-1}(v)\})$ , we have a unique representation  $T^k(v) = a_0v + a_1T(v) + \dots + a_{k-1}T^{k-1}(v)$ . Then,

$$p_{T_W}(t) = t^k - a_{k-1}t^{k-1} - \dots - a_1t - a_0$$

*Proof.* Left as homework.

Hint for 2.: use  $\beta := \{v, \dots, T^{k-1}(v)\}$  representation of  $[T_W]_{\beta}$ .

**Remark 4.7.** Note that if V itself T-cyclic for some v, then T "satisfies" its own characteristic polynomial. Indeed,  $p_T(t) = t^n - a_{n-1}t^{n-1} - \cdots - a_0$  and so

$$p_T(T) := T^n - a_{n-1}T^{n-1} - \dots - a_0I_V$$

is equal to 0 on v, and hence on all vectors  $u \in V$  since  $V = \operatorname{Span}(\{v, T(v), \dots, T^{n-1}(v)\})$  because

$$p_T(T)(T^i)(v) = T^{n+i}(v) - a_{n-1}T^{n-1+i}(v) - \cdots - a_0T^i(v) = (T^i \circ p_T(T))(v) = T^i(p_T(v)) = T^i(0) = 0.$$

Even more generally, we have that this is true in general, precisely:

### → Theorem 4.3: Cayley-Hamilton Theorem

Let V be finite dimensional and  $T: V \to V$  be linear. Then T satisfies its own characteristic polynomial  $p_T(t) = t^n + a_{n-1}t^{n-1} + \cdots + a_0$ , ie

$$p_T(T) = T^n + a_{n-1}T^{n-1} + \dots + a_0I_V \equiv 0_V.$$

*Proof.* Fix  $v \in V$ . Let W := T-cyclic subspace generated by v, so  $p_{T_W}(t)|p_T(t)$ , ie  $p_T(t) = q(t) \cdot p_{T_W}(t)$ . Hence  $\overline{p_T(T)} = q(T) \circ p_{T_W}(T)$ , and thus

$$p_T(T)(v) = q(T)(p_{T_W}(T)(v)) \stackrel{\text{lemma } 4.2}{=} q(T)(0) = 0.$$

## **←** Corollary 4.5: Cayley-Hamilton for Matrices

For every  $A \in M_n(\mathbb{F})$ ,  $p_A(A) = 0$ .

*Proof.* Follows immediately from  $[L_A]_{\alpha} = A$ .

 $\hookrightarrow Lecture~30; Last~Updated:~Mon~Mar~25~13:48:03~EDT~2024$ 

## 5 INNER PRODUCT SPACES

#### 5.1 Introduction

For this section,  $\mathbb{F}$  will always be either  $\mathbb{R}$  or  $\mathbb{C}$ .

### **→ Definition 5.1: Inner Product**

Let V be a vector space over  $\mathbb{F}$ . An *inner product* on V is a function

$$V \times V \to \mathbb{F}, \qquad (u, v) \mapsto \langle u, v \rangle,$$

satisfying, for all  $u, v, w \in V$  and  $\alpha \in \mathbb{F}$ ,

- 1. Linear in the first coordinate:
  - (a)  $\langle u + v, w \rangle = \langle u, w \rangle + \langle v, w \rangle$
  - (b)  $\langle \alpha u, v \rangle = \alpha \cdot \langle u, v \rangle$
- 2. Skew-symmetric:
  - (a)  $\langle u, v \rangle = \overline{\langle v, u \rangle}$
- 3.  $\langle u, u \rangle \ge 0$ , and equal to 0 iff  $u = 0_V$ .

*V* together with  $\langle ., . \rangle$  is called an *inner product space*.

**Remark 5.1.** Note that the third requirement is well-defined; that is, it follows from 2. that  $\langle u, u \rangle \in \mathbb{R}$ , so it makes sense to require it to be geq 0 (if it was complex, this would be meaningless).

### **○→ Definition 5.2**

Let  $\langle .,. \rangle$  be an inner product on V. The *norm* associated to this inner product is defined

$$||v|| := \sqrt{\langle v, v \rangle}, \quad v \in V.$$

We call  $v \in V$  a unit vector if ||v|| = 1. For  $v \in V$ ,  $v \neq 0$ , we call  $||v||^{-1} \cdot v$  the normalization of v.

Remark 5.2. Never work with a norm directly; working with the square of the norm is far easier.

## $\hookrightarrow$ Proposition 5.1

Let *V* be an inner product space. For each  $u, v, w \in V$  and  $\alpha \in \mathbb{F}$ ,

- 1. Conjugate linearity in the second coordinate holds:
  - (a)  $\langle u, v + w \rangle = \langle u, v \rangle + \langle u, w \rangle$
  - (b)  $\langle u, \alpha v \rangle = \overline{\alpha} \langle u, v \rangle$
- 2.  $||\alpha \cdot v|| = |\alpha| \cdot ||v||$
- 3.  $||v, 0_V|| = 0 = ||0_V, v||$

*Proof.* 1.(a), (b) follow from skew-symmetry.

For 2., we have  $||\alpha v||^2 = \langle \alpha v, \alpha v \rangle = \alpha \cdot \overline{\alpha} \langle v, v \rangle = |\alpha|^2 \cdot ||v||^2$ .

For 3., follows from  $\langle 0_V, v \rangle + \langle 0_V, v \rangle = \langle 0_V, v \rangle$ .

#### **⊗ Example 5.1**

1. For  $V := \mathbb{F}^n$ , the standard inner product is the "dot product"; for  $\vec{x} := (x_1, \dots, x_n), \vec{y} := (y_1, \dots, y_n),$ 

$$\langle \vec{x}, \vec{y} \rangle := \vec{x} \cdot \vec{y} := \sum_{i=1}^{n} x_i \overline{y_i},$$

which gives

$$||\vec{x}|| = \sqrt{\sum_{i=1}^{n} |x_i|^2},$$

that is, the standard Euclidean norm.

### $\hookrightarrow$ Proposition 5.2

For  $\mathbb{F} := \mathbb{R}$  and  $\vec{x}, \vec{y} \in \mathbb{R}^n, \vec{x} \cdot \vec{y} = ||\vec{x}|| ||\vec{y}|| \cos \alpha$ , where  $\alpha$  the angle from  $\vec{x}$  to  $\vec{y}$ .

- 2. If  $\langle .,. \rangle$  an inner product on V and r a positive real, then  $\langle .,. \rangle_r := r \cdot \langle .,. \rangle$  is also an inner product.
- 3. Let V := C[0,1]. Define for  $f, g \in V$ ,

$$\langle f, g \rangle := \int_0^1 f(t) \cdot \overline{g(t)} \, dt.$$

4. Let  $V := \mathbb{F}[t]_n$ . For  $f(t) := a_0 + a_1 t + \dots + a_n t^n$ ,  $g(t) := b_0 + b_1 t + \dots + b_n t^n$ , define

$$\langle f, g \rangle_1 := \sum_{i=0}^n a_i \overline{b_i},$$

and

$$\langle f, g \rangle_2 := \int_0^1 f(t) \overline{g(t)} \, \mathrm{d}t \,.$$

These are both inner products.

5. For  $A \in M_{n \times m}(\mathbb{F})$ , let  $A^* := \overline{A}^t$  the *conjugate transpose of* A. <sup>19</sup> For  $V := M_n(\mathbb{F})$  and  $A, B \in V$ , define

$$\langle A, B \rangle := \operatorname{tr}(B^* \cdot A).$$

It is left as a (homework) exercise to verify that this is a well-defined inner product.

 $\hookrightarrow Lecture~31; Last~Updated:~Thu~Mar~28~13:50:29~EDT~2024$ 

## 5.2 Projections and Cauchy-Schwartz

### **→ Definition 5.3: Orthogonal**

Let *V* be an inner product space. Call  $u, v \in V$  orthogonal, and write  $u \perp v$ , if  $\langle u, v \rangle = 0$ .

### **⊗ Example 5.2**

In  $\mathbb{R}^3$  equipped with the dot product,  $(1,0,-1) \perp (1,0,1)$ .

### **→ Theorem** 5.1: Pythagorean Theorem

For an inner product space V and  $u, v \in V$ , if  $u \perp v$  then

$$||u||^2 + ||v||^2 = ||u + v||^2$$
.

In particular, ||u||,  $||v|| \le ||u + v||$ .

Proof.

$$||u+v||^2 = \langle u+v, u+v \rangle = \langle u, u \rangle + \langle u, v \rangle + \langle v, u \rangle + \langle v, v \rangle = ||u||^2 + ||v||^2.$$

## $\hookrightarrow$ **Definition** 5.4

For vectors u, v in an inner product space V, if u is a unit vector, then put

$$\operatorname{proj}_{u}(v) := \langle v, u \rangle \cdot u.$$

## **←** Proposition 5.3

Let V be an inner product space and  $u \in V$  a unit vector. For each  $v \in V$ ,  $v - \text{proj}_u(v) \perp u$ . In particular,  $v = \text{proj}_u(v) + w$  where  $w := v - \text{proj}_u(v) \perp \text{proj}_u(v)$ .

<sup>&</sup>lt;sup>19</sup>Where  $\overline{A} := (\overline{a_{ij}})$ .

Proof.

$$\langle v - \operatorname{proj}_{u}(v), u \rangle = \langle v, u \rangle - \langle \operatorname{proj}_{u}(v), u \rangle = \langle v, u \rangle - \langle v, u \rangle \cdot \langle u, u \rangle = \langle v, u \rangle - \langle v, u \rangle = 0.$$

### $\hookrightarrow$ Corollary 5.1

Let *V* be an inner product space and  $u \in V$  a unit vector. For each  $v \in V$ ,  $||\operatorname{proj}_u(v)|| \leq ||v||$ .

*Proof.*  $\operatorname{proj}_u(v) \perp w := v - \operatorname{proj}_u(v)$ , hence  $||\operatorname{proj}_u(v)|| \leq ||\operatorname{proj}_u(v) + w|| = ||v||$  by the Pythagorean theorem.

#### → Theorem 5.2

Let *V* be an inner product space and  $x, y \in V$ .

- (a) (Cauchy-Banyakovski-Schwartz inequality)  $|\langle x, y \rangle| \le ||x|| \cdot ||y||$ .
- (b) (Triangle inequality)  $||x + y|| \le ||x|| + ||y||$ .

*Proof.* (a) If ||y|| = 0 then  $y = 0_V$  and  $0 \le 0$  and we are done. Suppose  $||y|| \ne 0$  and divide both sides by ||y||:

$$\langle x, ||y||^{-1} \cdot y \rangle \le ||x||,$$

ie, we need to prove  $|\langle x, y \rangle| \le ||x||$ , where u a unit. But

$$|\langle x,u\rangle|=||\langle x,u\rangle\cdot u||=||\mathrm{proj}_u(x)||\leq ||x||$$

by the previous corollary.

(b) We equivalently prove  $||x + y||^2 \le (||x|| + ||y||)^2$ . We have:

$$||x + y||^{2} = \langle x + y, x + y \rangle = \langle x, x \rangle + \langle x, y \rangle + \langle y, x \rangle + \langle y, y \rangle$$

$$\leq ||x||^{2} + ||y||^{2} + 2|\langle x, y \rangle|$$

$$\stackrel{\text{(by CBS)}}{\leq} ||x||^{2} + ||y||^{2} + 2||x||||y|| = (||x|| + ||y||)^{2}.$$

## **⊗ Example 5.3**

- 1. For  $\mathbb{F}^n$ , CS claims that  $\left|\sum_{i=1}^n x_i y_i\right| \leq \sqrt{\sum_{i=1}^n |x_i|^2} \sqrt{\sum_{i=1}^n |y_i|^2}$ , but  $\langle x, y \rangle = ||x|| ||y|| \cos \alpha$ , so this simply follow from  $|\cos \alpha| \leq 1$ .
- 2. For  $f, g \in C[0, 1]$ ,  $\int_0^1 f(t)g(t) dt \le \sqrt{\int_0^1 |f(t)|^2 dt} \sqrt{\int_0^1 |g(t)|^2 dt}$ .

From the triangle inequality, it is natural to define  $d: V \times V \to [0, \infty)$  d(u, v) := ||u - v|| as the "distance" between vectors u, v; indeed, one can show that such a d defines a metric on V.

### → Proposition 5.4: The Parallelogram Law

For an inner product space V and  $u, v \in V$ ,

- (a)  $2||u||^2 + 2||v||^2 = ||u + v||^2 + ||v u||^2$ .
- (b)  $\operatorname{Re}\langle u, v \rangle = \frac{1}{2} (||u||^2 + ||v||^2 ||v u||^2)$

*Proof.* Let as a (homework) exercise.

## 5.3 Orthogonality and Orthonormal Bases

### → **Definition** 5.5: Orthogonal/Orthonormal

Call a set  $S \subseteq V$  orthogonal (resp. orthonormal) if the vectors in S are pair-wise orthogonal to each (resp. in addition, they are unit).

### $\hookrightarrow$ Proposition 5.5

Orthonormal sets of nonzero vectors are linearly independent.

*Proof.* Suppose  $a_1v_1 + \cdots + a_nv_n = 0_V$ ,  $v_1, \ldots, v_n$  orthogonal. Then

$$\langle a_1 v_1 + \dots + a_n v_n, v_i \rangle = \langle 0_V, v_i \rangle = 0$$

$$\implies \sum_{j=1}^n a_j \langle v_j, v_i \rangle = a_i \underbrace{\langle v_i, v_i \rangle}_{\neq 0},$$

hence  $a_i$ 's identically zero.
